1.) Find the value of Trigonometric ratios in each of the following provided one of the six trigonometric ratios are given.

Sol.

(i)  $\sin A = \frac{2}{3}$

Given:

$$\sin A = \frac{2}{3} \dots\dots (1)$$

By definition,

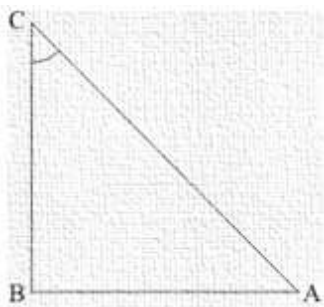

$$\sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{2}{3} \dots\dots (2)$$

By Comparing (1) and (2)

We get,

Perpendicular side = 2 and

Hypotenuse = 3

Therefore, by Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of perpendicular side (BC) and hypotenuse (AC) and get the base side (AB)

Therefore,

$$3^2 = AB^2 + 2^2$$

$$AB^2 = 3^2 - 2^2$$

$$AB^2 = 9 - 4$$

$$AB^2 = 5$$

$$AB = \sqrt{5}$$

Hence, Base =  $\sqrt{5}$

$$\text{Now, } \cos A = \frac{\text{Base}}{\text{Hypotenuse}}$$

$$\cos A = \frac{\sqrt{5}}{3}$$

$$\text{Now, } \csc A = \frac{1}{\sin A}$$

Therefore,

$$\csc A = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\csc A = \frac{3}{2}$$

$$\text{Now, } \sec A = \frac{\text{Hypotenuse}}{\text{Base}}$$

Therefore,

$$\sec A = \frac{3}{\sqrt{5}}$$

$$\text{Now, } \tan A = \frac{\text{Perpendicular}}{\text{Base}}$$

$$\tan A = \frac{2}{\sqrt{5}}$$

$$\text{Now, } \cot A = \frac{\text{Base}}{\text{Perpendicular}}$$

Therefore,

$$\cot A = \frac{\sqrt{5}}{2}$$

$$\text{(ii) } \cos A = \frac{4}{5}$$

$$\text{Given: } \cos A = \frac{4}{5} \dots (1)$$

By Definition,

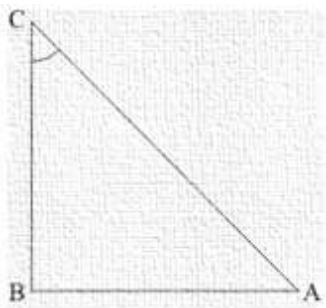

$$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} \dots (2)$$

By comparing (1) and (2)

We get,

Base = 4 and

Hypotenuse = 5

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base (AB) and hypotenuse (AC) and get the perpendicular side (BC)

$$5^2 = 4^2 + BC^2$$

$$BC^2 = 5^2 - 4^2$$

$$BC^2 = 25 - 16$$

$$BC^2 = 9$$

$$BC = 3$$

Hence, Perpendicular side = 3

Now,

$$\sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{3}{5}$$

Therefore,

$$\sin A = \frac{3}{5}$$

$$\text{Now, cosec } A = \frac{1}{\sin A}$$

Therefore,

$$\text{cosec } A = \frac{1}{\sin A}$$

Therefore,

$$\text{cosec } A = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\text{cosec } A = \frac{5}{3}$$

$$\text{Now, } \sec A = \frac{1}{\cos A}$$

Therefore,

$$\sec A = \frac{\text{Hypotenuse}}{\text{Base}}$$

$$\sec A = 5 \frac{5}{4}$$

$$\text{Now, } \tan A = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\tan A = 3 \frac{3}{4}$$

$$\text{Now, } \cot A = \frac{1}{\tan A}$$

Therefore,

$$\cot A = \frac{\text{Base}}{\text{Perpendicular}}$$

$$\cot A = 3 \frac{4}{3}$$

$$\text{(iii) } \tan \Theta = 11 \tan \Theta = \frac{11}{1}$$

$$\text{Given: } \tan \Theta = 11 \tan \Theta = \frac{11}{1} \dots (1)$$

By definition,

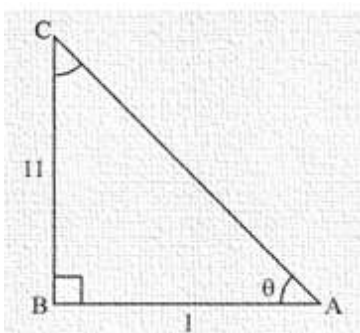

$$\tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \tan \Theta = \dots (2)$$

By Comparing (1) and (2)

We get,

Base = 1 and

Perpendicular side = 5

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base side (AB) and perpendicular side (BC) and get hypotenuse(AC)

$$AC^2 = 1^2 + 11^2$$

$$AC^2 = 1 + 121$$

$$AC^2 = 122$$

$$AC = \sqrt{122} \sqrt{122}$$

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{11}{\sqrt{122}} \sin \Theta = \frac{11}{\sqrt{122}}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} \operatorname{cosec} \Theta = \frac{1}{\sin \Theta}$$

$$\operatorname{cosec} \Theta = \frac{\sqrt{122}}{11} \operatorname{cosec} \Theta = \frac{\sqrt{122}}{11}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{1}{\sqrt{122}} \cos \Theta = \frac{1}{\sqrt{122}}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \sec \Theta = \frac{\sqrt{122}}{1} \sec \Theta = \sqrt{122} \sec \Theta = \sqrt{122}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} \cot \Theta = \frac{1}{\tan \Theta}$$

Therefore,

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \cot \Theta = \frac{1}{11} \cot \Theta = \frac{1}{11}$$

$$\text{(iv) } \sin \Theta = \frac{11}{15} \sin \Theta = \frac{11}{15}$$

$$\text{Given: } \sin \Theta = \frac{11}{15} \sin \Theta = \frac{11}{15} \dots (1)$$

By definition,

$$\sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \dots (2)$$

By Comparing (1) and (2)

We get,

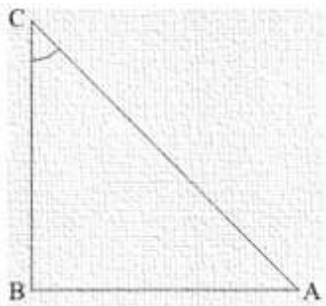

Perpendicular Side = 11 and

Hypotenuse = 15

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of perpendicular side (BC) and hypotenuse (AC) and get the base side (AB)

$$15^2 = AB^2 + 11^2$$

$$AB^2 = 15^2 - 11^2$$

$$AB^2 = 225 - 121$$

$$AB^2 = 104$$

$$AB = \sqrt{104} \sqrt{104}$$

$$AB = \sqrt{2 \times 2 \times 2 \times 13} \sqrt{2 \times 2 \times 2 \times 13}$$

$$AB = 2\sqrt{2 \times 13} \sqrt{2 \times 13}$$

$$AB = 2\sqrt{26} \sqrt{26}$$

$$\text{Hence, Base} = 2\sqrt{26} \sqrt{26}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{2\sqrt{26}}{15} \cos \Theta = \frac{2\sqrt{26}}{15}$$

$$\text{Now, cosec} \Theta = \frac{1}{\sin \Theta} = \frac{1}{\sin \Theta}$$

Therefore,

$$\text{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\text{cosec} \Theta = \frac{15}{11} = \frac{15}{11}$$

$$\text{Now, sec} \Theta = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{\text{Hypotenuse}}{\text{Base}}$$

Therefore,

$$\text{sec} \Theta = \frac{15}{2\sqrt{26}} = \frac{15}{2\sqrt{26}}$$

$$\text{Now, tan} \Theta = \frac{\text{Perpendicular}}{\text{Base}} = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\text{tan} \Theta = \frac{11}{2\sqrt{26}} = \frac{11}{2\sqrt{26}}$$

$$\text{Now, cot} \Theta = \frac{\text{Base}}{\text{Perpendicular}} = \frac{\text{Base}}{\text{Perpendicular}}$$

Therefore,

$$\text{cot} \Theta = \frac{2\sqrt{26}}{11} = \frac{2\sqrt{26}}{11}$$

$$\text{(v) } \tan \alpha = \frac{5}{12}$$

$$\text{Given: } \tan \alpha = \frac{5}{12} \dots (1)$$

By definition,

$$\tan \alpha = \frac{\text{Perpendicular}}{\text{Base}} \dots (2)$$

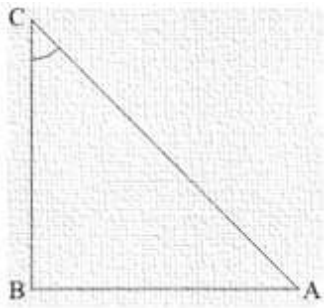

By comparing (1) and (2)

We get,

Base = 12 and

Perpendicular side = 5

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base side (AB) and the perpendicular side (BC) and get hypotenuse (AC)

$$AC^2 = 12^2 + 5^2$$

$$AC^2 = 144 + 25$$

$$AC^2 = 169$$

$$AC = 13$$

Hence Hypotenuse = 13

$$\text{Now, } \sin \alpha = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \quad \sin \alpha = \frac{5}{13}$$

Therefore,

$$\sin \alpha = \frac{5}{13}$$

$$\text{Now, } \operatorname{cosec} \alpha = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \quad \operatorname{cosec} \alpha = \frac{13}{5}$$

$$\operatorname{cosec} \alpha = \frac{13}{5}$$

$$\text{Now, } \cos \alpha = \frac{\text{Base}}{\text{Hypotenuse}} \quad \cos \alpha = \frac{12}{13}$$

Therefore,

$$\cos \alpha = \frac{12}{13}$$

$$\text{Now, } \sec \alpha = \frac{1}{\cos \alpha} \quad \sec \alpha = \frac{13}{12}$$

Therefore,

$$\cot \alpha = \frac{\text{Base}}{\text{Perpendicular}} \quad \cot \alpha = \frac{12}{5}$$

$$(vi) \sin \Theta = \frac{\sqrt{3}}{2}$$

$$\text{Given: } \sin \Theta = \frac{\sqrt{3}}{2} \dots (1)$$

By definition,

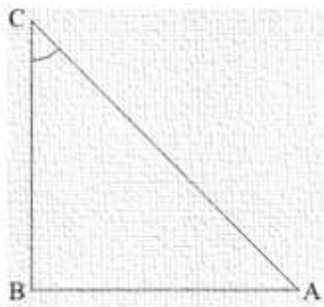

$$\sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \dots (2)$$

By comparing (1) and (2)

We get,

$$\text{Perpendicular Side} = \sqrt{3}$$

$$\text{Hypotenuse} = 2$$

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of perpendicular side (BC) and hypotenuse (AC) and get the base side (AB)

$$2^2 = AB^2 + (\sqrt{3})^2$$

$$AB^2 = 2^2 - (\sqrt{3})^2$$

$$AB^2 = 4 - 3$$

$$AB^2 = 1$$

$$AB = 1$$

Hence Base = 1

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{1}{2}$$

$$\text{Now, cosec}\Theta = \frac{1}{\sin\Theta} = \frac{1}{\frac{1}{2\sqrt{3}}} = 2\sqrt{3}$$

Therefore,

$$\text{cosec}\Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} = \frac{25}{12.5} = 2$$

$$\text{cosec}\Theta = 2\sqrt{3} \Rightarrow \frac{2}{\sqrt{3}} = 2$$

$$\text{Now, sec}\Theta = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{25}{12.5} = 2$$

Therefore,

$$\text{sec}\Theta = 2 \Rightarrow \frac{25}{12.5} = 2$$

$$\text{Now, tan}\Theta = \frac{\text{Perpendicular}}{\text{Base}} = \frac{12.5}{12.5} = 1$$

Therefore,

$$\text{tan}\Theta = 1 \Rightarrow \frac{12.5}{12.5} = 1$$

$$\text{Now, cot}\Theta = \frac{\text{Base}}{\text{Perpendicular}} = \frac{12.5}{12.5} = 1$$

Therefore,

$$\text{cot}\Theta = 1 \Rightarrow \frac{12.5}{12.5} = 1$$

$$\text{(vii) cos}\Theta = \frac{7}{25}$$

$$\text{Given: cos}\Theta = \frac{7}{25} \dots (1)$$

By definition,

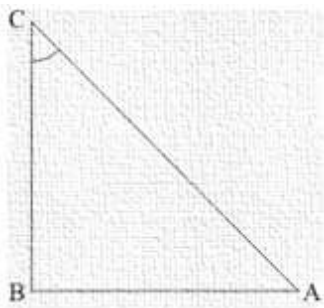

$$\text{cos}\Theta = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{7}{25}$$

By comparing (1) and (2)

We get,

Base = 7 and

Hypotenuse = 25

Therefore

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base side (AB) and hypotenuse (AC) and get the perpendicular side (BC)

$$25^2 = 7^2 + BC^2$$

$$BC^2 = 25^2 - 7^2$$

$$BC^2 = 625 - 49$$

$$BC = 576$$

$$BC = \sqrt{576} \sqrt{576}$$

$$BC = 24$$

Hence, Perpendicular side = 24

$$\text{Now, } \sin \Theta = \frac{\text{perpendicular}}{\text{Hypotenuse}} \quad \sin \Theta = \frac{\text{perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{24}{25} \quad \sin \Theta = \frac{24}{25}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} \quad \operatorname{cosec} \Theta = \frac{1}{\sin \Theta}$$

Therefore,

$$\operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \quad \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} \Theta = \frac{25}{24} \quad \operatorname{cosec} \Theta = \frac{25}{24}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} \quad \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \quad \sec \Theta = \frac{25}{7} \quad \sec \Theta = \frac{25}{7}$$

$$\text{Now, } \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\tan \Theta = \frac{24}{7} \tan \Theta = \frac{24}{7}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} \cot \Theta = \frac{1}{\tan \Theta}$$

Therefore,

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \cot \Theta = \frac{7}{24} \cot \Theta = \frac{7}{24}$$

$$\text{(viii) } \tan \Theta = \frac{8}{15} \tan \Theta = \frac{8}{15}$$

$$\text{Given: } \tan \Theta = \frac{8}{15} \dots (1)$$

By definition,

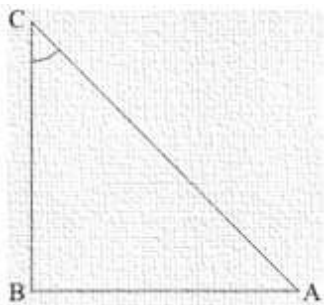

$$\tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \dots (2)$$

By comparing (1) and (2)

We get,

Base = 15 and

Perpendicular side = 8

Therefore,

By Pythagoras theorem,

$$AC^2 = 15^2 + 8^2$$

$$AC^2 = 225 + 64$$

$$AC^2 = 289$$

$$AC = \sqrt{289} = 17$$

$$AC = 17$$

Hence, Hypotenuse = 17

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \quad \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{8}{17} \quad \sin \Theta = \frac{8}{17}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} \quad \operatorname{cosec} \Theta = \frac{1}{\sin \Theta}$$

Therefore,

$$\operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \quad \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} \Theta = \frac{17}{8} \quad \operatorname{cosec} \Theta = \frac{17}{8}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \quad \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{15}{17} \quad \cos \Theta = \frac{15}{17}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} \quad \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \quad \sec \Theta = \frac{17}{15} \quad \sec \Theta = \frac{17}{15}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} \quad \cot \Theta = \frac{1}{\tan \Theta}$$

Therefore,

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \quad \cot \Theta = \frac{15}{8} \quad \cot \Theta = \frac{15}{8}$$

$$\text{(ix) } \cot \Theta = \frac{12}{5} \quad \cot \Theta = \frac{12}{5}$$

$$\text{Given: } \cot \Theta = \frac{12}{5} \quad \dots (1)$$

By definition,

$$\cot \Theta = \frac{1}{\tan \Theta} \quad \cot \Theta = \frac{1}{\tan \Theta}$$

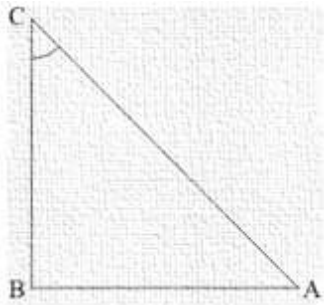

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \quad \dots (2)$$

By comparing (1) and (2)

We get,

Base = 12 and

Perpendicular side = 5

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base side (AB) and perpendicular side(BC) and get the hypotenuse (AC)

$$AC^2 = 12^2 + 5^2$$

$$AC^2 = 144 + 25$$

$$AC^2 = 169$$

$$AC = \sqrt{169} = 13$$

$$AC = 13$$

Hence, Hypotenuse = 13

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{5}{13} \sin \Theta = \frac{5}{13}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} \operatorname{cosec} \Theta = \frac{1}{\sin \Theta}$$

Therefore,

$$\operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} \Theta = \frac{13}{5} \operatorname{cosec} \Theta = \frac{13}{5}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{12}{13} \cos \Theta = \frac{12}{13}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \sec \Theta = \frac{13}{12} \sec \Theta = \frac{13}{12}$$

$$\text{Now, } \tan \Theta = \frac{1}{\cot \Theta} \tan \Theta = \frac{1}{\cot \Theta}$$

Therefore,

$$\tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \tan \Theta = \frac{5}{12} \tan \Theta = \frac{5}{12}$$

$$\text{(x) } \sec \Theta = \frac{13}{5} \sec \Theta = \frac{13}{5}$$

$$\text{Given: } \sec \Theta = \frac{13}{5} \sec \Theta = \frac{13}{5} \dots (1)$$

By definition,

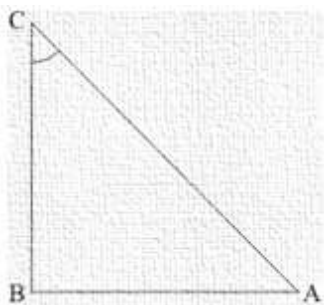

$$\sec \Theta = \frac{1}{\cos \Theta} \sec \Theta = \frac{1}{\cos \Theta} \dots (2)$$

By comparing (1) and (2)

We get,

$$\text{Base} = 5$$

$$\text{Hypotenuse} = 13$$

Therefore,

By Pythagoras theorem,

Substituting the value of base side (AB) and hypotenuse (AC) and get the perpendicular side (BC)

$$13^2 = 5^2 + BC^2$$

$$BC^2 = 13^2 - 5^2$$

$$BC^2 = 169 - 25$$

$$BC^2 = 144$$

$$BC = \sqrt{144} = 12$$

$$BC = 12$$

Hence, Perpendicular side = 12

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \quad \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{12}{13} \quad \sin \Theta = \frac{12}{13}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} = \frac{1}{\sin \Theta}$$

Therefore,

$$\operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \quad \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} \Theta = \frac{13}{12} \quad \operatorname{cosec} \Theta = \frac{13}{12}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \quad \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \quad \cos \Theta = \frac{5}{13} \quad \cos \Theta = \frac{5}{13}$$

$$\text{Now, } \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \quad \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\tan \Theta = \frac{12}{5} \quad \tan \Theta = \frac{12}{5}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} = \frac{1}{\tan \Theta}$$

Therefore,

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \quad \cot \Theta = \frac{5}{12} \quad \cot \Theta = \frac{5}{12}$$

$$\text{(xi) } \operatorname{cosec} \Theta = \sqrt{10} \quad \operatorname{cosec} \Theta = \sqrt{10}$$

$$\text{Given: } \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} = \frac{\sqrt{10}}{1} \dots (1)$$

By definition

$$\operatorname{cosec} \Theta = \frac{1}{\sin \Theta} \dots (2)$$

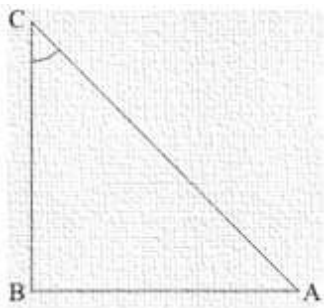

$$\Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

By comparing (1) and (2)

We get,

Perpendicular side = 1 and

$$\text{Hypotenuse} = \sqrt{10}$$

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of perpendicular side (BC) and hypotenuse (AC) and get the base side (AB)

$$(\sqrt{10})^2 = AB^2 + 1^2$$

$$AB^2 = (\sqrt{10})^2 - 1^2$$

$$AB^2 = 10 - 1$$

$$AB = \sqrt{9}$$

$$AB = 3$$

Hence, Base side = 3

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{1}{\sqrt{10}}$$

$$\text{Now, } \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}}$$

Therefore,

$$\cos \Theta = \frac{3}{\sqrt{10}} \cos \Theta = \frac{3}{\sqrt{10}}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \sec \Theta = \frac{\sqrt{10}}{3} \sec \Theta = \frac{\sqrt{10}}{3}$$

$$\text{Now, } \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\tan \Theta = \frac{1}{3} \tan \Theta = \frac{1}{3}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} \cot \Theta = \frac{1}{\tan \Theta}$$

$$\cot \Theta = \frac{3}{1} \cot \Theta = 3 \cot \Theta = 3$$

$$\text{(xii) } \cos \Theta = \frac{12}{15}$$

$$\text{Given: } \cos \Theta = \frac{12}{15} \dots (1)$$

By definition,

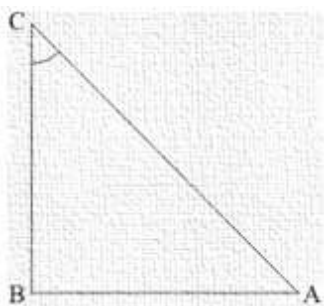

$$\cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base}}{\text{Hypotenuse}} \dots (2)$$

By comparing (1) and (2)

We get,

Base = 12 and

Hypotenuse = 15

Therefore,

By Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

Substituting the value of base side (AB) and hypotenuse (AC) and get the perpendicular side (BC)

$$15^2 = 12^2 + BC^2$$

$$BC^2 = 15^2 - 12^2$$

$$BC^2 = 225 - 144$$

$$BC^2 = 81$$

$$BC = \sqrt{81} = 9$$

$$BC = 9$$

Hence, Perpendicular side = 9

$$\text{Now, } \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} \quad \sin \Theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}}$$

Therefore,

$$\sin \Theta = \frac{9}{15}$$

$$\text{Now, } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta} = \frac{15}{9}$$

Therefore,

$$\operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}} \quad \operatorname{cosec} \Theta = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} \Theta = \frac{15}{9}$$

$$\text{Now, } \sec \Theta = \frac{1}{\cos \Theta} = \frac{15}{12}$$

Therefore,

$$\sec \Theta = \frac{\text{Hypotenuse}}{\text{Base}} \quad \sec \Theta = \frac{15}{12}$$

$$\text{Now, } \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}} \quad \tan \Theta = \frac{\text{Perpendicular}}{\text{Base}}$$

Therefore,

$$\tan \Theta = \frac{9}{12}$$

$$\text{Now, } \cot \Theta = \frac{1}{\tan \Theta} = \frac{12}{9}$$

Therefore,

$$\cot \Theta = \frac{\text{Base}}{\text{Perpendicular}} \quad \cot \Theta = \frac{12}{9}$$

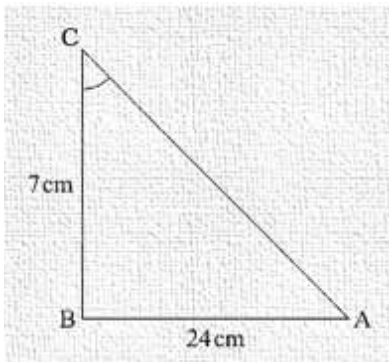

2.) In a  $\Delta ABC$ , right angled at B, AB = 24 cm, BC = 7 cm, Determine

(i)  $\sin A$ ,  $\cos A$

(ii)  $\sin C$ ,  $\cos C$

Sol.

(i) The given triangle is below:

Given: In  $\Delta ABC$ , AB = 24 cm

BC = 7 cm

$\angle ABC = 90^\circ$

To find:  $\sin A$ ,  $\cos A$

In this problem, Hypotenuse side is unknown

Hence we first find hypotenuse side by Pythagoras theorem

By Pythagoras theorem,

We get,

$$AC^2 = AB^2 + BC^2$$

$$AC^2 = 24^2 + 7^2$$

$$AC^2 = 576 + 49$$

$$AC^2 = 625$$

$$AC = \sqrt{625} = 25$$

$$AC = 25$$

Hypotenuse = 25

By definition,

$$\sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}} \quad \sin A = \frac{BC}{AC}$$
$$\sin A = \frac{7}{25} \quad \sin A = \frac{7}{25}$$

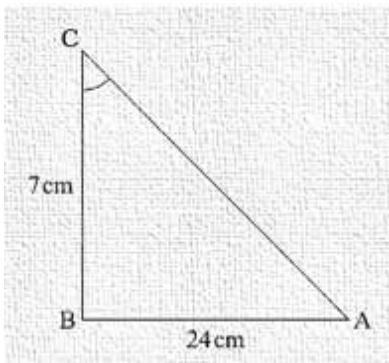

By definition,

$$\cos A = \frac{\text{Base side adjacent to } \angle A}{\text{Hypotenuse}} \quad \cos A = \frac{AB}{AC}$$
$$\cos A = \frac{24}{25} \quad \cos A = \frac{24}{25}$$

Answer:

$$\sin A = \frac{7}{25}, \quad \cos A = \frac{24}{25}$$

(ii) The given triangle is below:

Given: In  $\triangle ABC$ ,  $AB = 24$  cm

$$BC = 7 \text{ cm}$$

$$\angle ABC = 90^\circ$$

To find:  $\sin C$ ,  $\cos C$

In this problem, Hypotenuse side is unknown

Hence we first find hypotenuse side by Pythagoras theorem

By Pythagoras theorem,

We get,

$$AC^2 = AB^2 + BC^2$$

$$AC^2 = 24^2 + 7^2$$

$$AC^2 = 576 + 49$$

$$AC^2 = \underline{625}$$

$$AC = \sqrt{625} = 25$$

$$AC = 25$$

$$\text{Hypotenuse} = 25$$

By definition,

$$\sin C = \frac{\text{Perpendicular side opposite to } \angle C}{\text{Hypotenuse}} \quad \sin C = \frac{AB}{AC}$$

$$\sin C = \frac{24}{25} \quad \sin C = \frac{24}{25}$$

By definition,

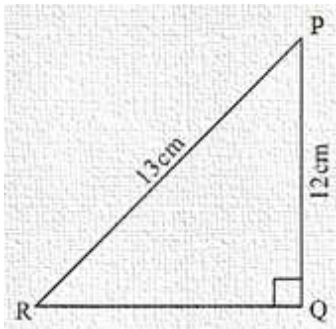

$$\cos C = \frac{\text{Base side adjacent to } \angle C}{\text{Hypotenuse}} \quad \cos C = \frac{BC}{AC}$$

$$\cos C = \frac{7}{25} \quad \cos C = \frac{7}{25}$$

Answer:

$$\sin C = \frac{24}{25}, \quad \cos C = \frac{7}{25}$$

3.) In the below figure, find  $\tan P$  and  $\cot R$ . Is  $\tan P = \cot R$ ?

To find,  $\tan P$ ,  $\cot R$

**Sol.**

In the given right angled  $\triangle PQR$ , length of side QR is unknown

Therefore, by applying Pythagoras theorem in  $\triangle PQR$

We get,

$$PR^2 = PQ^2 + QR^2$$

Substituting the length of given side PR and PQ in the above equation

$$13^2 = 12^2 + QR^2$$

$$QR^2 = 13^2 - 12^2$$

$$QR^2 = 169 - 144$$

$$QR^2 = 25$$

$$QR = \sqrt{25} = 5$$

By definition, we know that ,

$\tan P = \frac{\text{Perpendicular side opposite to } \angle P}{\text{Base side adjacent to } \angle P}$

$$\tan P = \frac{\text{Perpendicular side opposite to } \angle P}{\text{Base side adjacent to } \angle P} \quad \tan P = \frac{QR}{PQ} \quad \tan P = \frac{QR}{PQ}$$

$$\tan P = \frac{5}{12} \quad \tan P = \frac{5}{12} \quad \dots (1)$$

Also, by definition, we know that

$$\cot R = \frac{\text{Base side adjacent to } \angle R}{\text{Perpendicular side opposite to } \angle R} \quad \cot R = \frac{\text{Base side adjacent to } \angle R}{\text{Perpendicular side opposite to } \angle R}$$

$$\cot R = \frac{QR}{PQ} \quad \cot R = \frac{QR}{PQ}$$

$$\cot R = \frac{5}{12} \quad \cot R = \frac{5}{12} \quad \dots (2)$$

Comparing equation (1) and (2), we come to know that that R.H.S of both the equation are equal.

Therefore, L.H.S of both equations is also equal

$$\tan P = \cot R$$

Answer:

$$\text{Yes , } \tan P = \cot R = \frac{5}{12}$$

4.) If  $\sin A = \frac{9}{41}$ , Compute  $\cos A$  and  $\tan A$ .

Sol.

$$\text{Given: } \sin A = \frac{9}{41} \quad \sin A = \frac{9}{41} \quad \dots (1)$$

To find:  $\cos A$ ,  $\tan A$

By definition,

$$\sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}} \quad \sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}} \quad \dots (2)$$

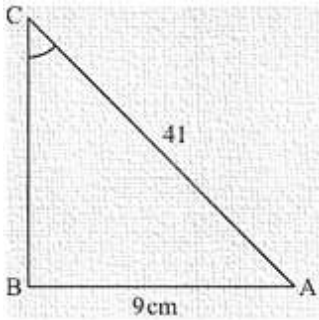

By comparing (1) and (2)

We get ,

Perpendicular side = 9 and

Hypotenuse = 41

Now using the perpendicular side and hypotenuse we can construct  $\triangle ABC$  as shown below

Length of side AB is unknown in right angled  $\triangle ABC$  ,

To find the length of side AB, we use Pythagoras theorem,

Therefore, by applying Pythagoras theorem in  $\triangle ABC$  ,

We get,

$$AC^2 = AB^2 + BC^2$$

$$41^2 = AB^2 + 9^2$$

$$AB^2 = 41^2 - 9^2$$

$$AB^2 = 1681 - 81$$

$$AB^2 = 1600$$

$$AB = \sqrt{1600}$$

$$AB = 40$$

Hence, length of side AB = 40

Now

By definition,

$$\cos A = \frac{\text{Base side adjacent to } \angle A}{\text{Hypotenuse}} \quad \cos A = \frac{AB}{AC}$$

$$\cos A = \frac{40}{41} \quad \cos A = \frac{40}{41}$$

Now,

By definition,

$\tan A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A}$

$$\tan A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A} \quad \tan A = \frac{BC}{AB} \quad \tan A = \frac{9}{40} \quad \tan A = \frac{9}{40}$$

Answer:

$$\cos A = \frac{40}{41}, \quad \tan A = \frac{9}{40}$$

5.) Given  $15 \cot A = 8$ , find  $\sin A$  and  $\sec A$ .

Answer:

$$\text{Given: } 15 \cot A = 8$$

To find:  $\sin A$ ,  $\sec A$

$$\text{Since } 15 \cot A = 8$$

By taking 15 on R.H.S

We get,

$$\cot A = \frac{8}{15}$$

By definition,

$$\cot A = \frac{1}{\tan A} \quad \cot A = \frac{1}{\tan A}$$

Hence,

$$\cot A = \frac{1}{\frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A}} \quad \cot A = \frac{1}{\frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A}}$$

$$\cot A = \frac{\text{Base side adjacent to } \angle A}{\text{Perpendicular side opposite to } \angle A} \quad \dots (2)$$

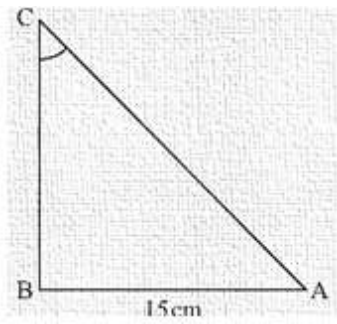

Comparing equation (1) and (2)

We get,

$$\text{Base side adjacent to } \angle A = 8$$

$$\text{Perpendicular side opposite to } \angle A = 15$$

$\triangle ABC$  can be drawn below using above information

Hypotenuse side is unknown.

Therefore, we find side AC of  $\triangle ABC$  by Pythagoras theorem.

So, by applying Pythagoras theorem to  $\triangle ABC$

We get,

$$AC^2 = AB^2 + BC^2$$

Substituting values of sides from the above figure

$$AC^2 = 8^2 + 15^2$$

$$AC^2 = 64 + 225$$

$$AC^2 = 289$$

$$AC = \sqrt{289}$$

$$AC = 17$$

Therefore, hypotenuse = 17

Now by definition,

$$\sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}} = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}}$$

$$\text{Therefore, } \sin A = \frac{BC}{AC}$$

Substituting values of sides from the above figure

$$\sin A = \frac{15}{17}$$

By definition,

$$\sec A = \frac{1}{\cos A}$$

Hence,

$$\sec A = \frac{\text{Hypotenuse}}{\text{Base side adjacent to } \angle A} \quad \sec A = \frac{1}{\frac{\text{Base side adjacent to } \angle A}{\text{Hypotenuse}}} \quad \sec A = \frac{\text{Hypotenuse}}{\text{Base side adjacent to } \angle A}$$

$$\sec A = \frac{\text{Hypotenuse}}{\text{Base side adjacent to } \angle A}$$

Substituting values of sides from the above figure

$$\sec A = 178 \quad \sec A = \frac{17}{8}$$

Answer:

$$\sin A = \frac{15}{17} \quad \sin A = \frac{15}{17}, \quad \sec A = \frac{17}{8} \quad \sec A = \frac{17}{8}$$

6.) In  $\triangle PQR$ , right angled at Q, PQ = 4cm and RQ = 3 cm. Find the value of sin P, sin R, sec P and sec R.

Sol.

Given:

$\triangle PQR$  is right angled at vertex Q.

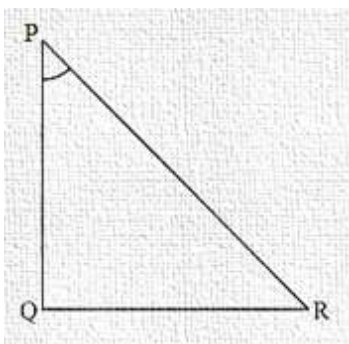

$$PQ = 4\text{cm}$$

$$RQ = 3\text{cm}$$

To find,

sin P, sin R, sec P, sec R

Given  $\triangle PQR$  is as shown below

Hypotenuse side PR is unknown.

Therefore, we find side PR of  $\triangle PQR$  by Pythagoras theorem

By applying Pythagoras theorem to  $\triangle PQR$

We get,

$$PR^2 = PQ^2 + RQ^2$$

Substituting values of sides from the above figure

$$PR^2 = 4^2 + 3^2$$

$$PR^2 = 16 + 9$$

$$PR^2 = 25$$

$$PR = \sqrt{25} = 5$$

$$PR = 5$$

Hence, Hypotenuse = 5

Now by definition,

$$\sin P = \frac{\text{Perpendicular side opposite to } \angle P}{\text{Hypotenuse}} \quad \sin P = \frac{RQ}{PR}$$

$$\sin P = \frac{RQ}{PR}$$

Substituting values of sides from the above figure

$$\sin P = \frac{3}{5} \quad \sin P = \frac{3}{5}$$

Now by definition,

$$\sin R = \frac{\text{Perpendicular side opposite to } \angle R}{\text{Hypotenuse}} \quad \sin R = \frac{PQ}{PR}$$

$$\sin R = \frac{PQ}{PR}$$

Substituting the values of sides from above figure

$$\sin R = \frac{4}{5} \quad \sin R = \frac{4}{5}$$

By definition,

$$\sec P = \frac{1}{\cos P} \quad \sec P = \frac{1}{\cos P} \quad \sec P = \frac{1}{\frac{\text{Base side adjacent to } \angle P}{\text{Hypotenuse}}}$$

$$\sec P = \frac{1}{\frac{\text{Base side adjacent to } \angle P}{\text{Hypotenuse}}} \quad \sec P = \frac{\text{Hypotenuse}}{\text{Base side adjacent to } \angle P}$$

Substituting values of sides from the above figure

$$\sec P = \frac{5}{4} \quad \sec P = \frac{5}{4}$$

By definition,

$$\sec R = \frac{1}{\cos R} \quad \sec R = \frac{1}{\cos R} \quad \sec R = \frac{1}{\frac{\text{Base side adjacent to } \angle R}{\text{Hypotenuse}}}$$

$$\sec R = \frac{1}{\frac{\text{Base side adjacent to } \angle R}{\text{Hypotenuse}}} \quad \sec R = \frac{\text{Hypotenuse}}{\text{Base side adjacent to } \angle R}$$

Substituting values of sides from the above figure

$$\sec R = \frac{PR}{RQ} \sec R = \frac{PR}{RQ} \sec R = 53 \sec R = \frac{5}{3}$$

Answer:

$$\sin P = \frac{3}{5}, \sin R = \frac{4}{5},$$

$$\sec P = \frac{5}{4}, \sec R = \frac{5}{3}$$

7.) If  $\cot \Theta = \frac{7}{8}$ , evaluate

$$(i) \frac{1 + \sin \Theta \times 1 - \sin \Theta}{1 + \cos \Theta \times 1 - \cos \Theta} \frac{1 + \sin \Theta \times 1 - \sin \Theta}{1 + \cos \Theta \times 1 - \cos \Theta}$$

$$(ii) \cot^2 \Theta$$

Sol.

$$\text{Given: } \cot \Theta = \frac{7}{8}$$

$$\text{To evaluate: } \frac{1 + \sin \Theta \times 1 - \sin \Theta}{1 + \cos \Theta \times 1 - \cos \Theta} \frac{1 + \sin \Theta \times 1 - \sin \Theta}{1 + \cos \Theta \times 1 - \cos \Theta}$$

$$\frac{1 + \sin \Theta \times 1 - \sin \Theta}{1 + \cos \Theta \times 1 - \cos \Theta} \dots (1)$$

We know the following formula

$$(a + b)(a - b) = a^2 - b^2$$

By applying the above formula in the numerator of equation (1)

We get,

$$(1 + \sin \theta) \times (1 - \sin \theta) = 1 - \sin^2 \theta \dots (2) \text{ (Where, } a=1 \text{ and } b=\sin \theta)$$

$$(1 + \sin \theta) \times (1 - \sin \theta) = 1 - \sin^2 \theta \dots (2) \text{ (Where, } a = 1 \text{ and } b = \sin \theta)$$

Similarly,

By applying formula  $(a + b)(a - b) = a^2 - b^2$  in the denominator of equation (1).

We get,

$$(1 + \cos \Theta)(1 - \cos \Theta) = 1 - \cos^2 \Theta \dots \text{ (Where } a=1 \text{ and } b= \cos \Theta)$$

$$(1 + \cos \Theta)(1 - \cos \Theta) = 1 - \cos^2 \Theta \dots \text{ (Where } a=1 \text{ and } b= \cos \Theta)$$

Substituting the value of numerator and denominator of equation (1) from equation (2), equation (3).

Therefore,

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = 1-\sin^2\Theta 1-\cos^2\Theta \frac{1-\sin^2\Theta}{1-\cos^2\Theta} \dots(4)$$

Since,

$$\cos^2\Theta + \sin^2\Theta = 1 \cos^2\Theta + \sin^2\Theta = 1$$

Therefore,

$$\cos^2\Theta = 1 - \sin^2\Theta \cos^2\Theta = 1 - \sin^2\Theta$$

$$\text{Also, } \sin^2\Theta = 1 - \cos^2\Theta \sin^2\Theta = 1 - \cos^2\Theta$$

Putting the value of  $1 - \sin^2\Theta$  and  $1 - \cos^2\Theta$  in equation (4)

We get,

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = \cos^2\Theta \sin^2\Theta \frac{\cos^2\Theta}{\sin^2\Theta}$$

$$\text{We know that, } \cos\Theta \sin\Theta = \cot\Theta \frac{\cos\Theta}{\sin\Theta} = \cot\Theta$$

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = (\cot\Theta)^2 (\cot\Theta)^2$$

$$\text{Since, it is given that } \cot\Theta = 78 \cot\Theta = \frac{7}{8}$$

Therefore,

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = (78)^2 \left(\frac{7}{8}\right)^2$$

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = 7^2 8^2 \frac{7^2}{8^2}$$

$$(1+\sin\Theta)(1-\sin\Theta)(1+\cos\Theta)(1-\cos\Theta) \frac{(1+\sin\Theta)(1-\sin\Theta)}{(1+\cos\Theta)(1-\cos\Theta)} = 4964 \frac{49}{64}$$

$$\text{(ii) Given: } \cot\Theta = 78 \cot\Theta = \frac{7}{8}$$

To evaluate:  $\cot^2\Theta \cot^2\Theta$

$$\cot\Theta = 78 \cot\Theta = \frac{7}{8}$$

Squaring on both sides,

We get,

$$(\cot\Theta)^2 = (78)^2 (\cot\Theta)^2 = \left(\frac{7}{8}\right)^2$$

$$(\cot\Theta)^2 (\cot\Theta)^2 = 4964 \frac{49}{64}$$

Answer:

$$4964 \frac{49}{64}$$

8.) If  $3\cot A = 4$  , check whether  $\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A$

$$\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A \text{ or not.}$$

**Sol.**

$$\text{Given: } 3\cot A = 4$$

To check whether  $\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A$  or not.

$$3\cot A = 4$$

Dividing by 3 on both sides,

We get,

$$\cot A = \frac{4}{3} \dots (1)$$

By definition,

$$\cot A = \frac{1}{\tan A}$$

Therefore,

$$\cot A = \frac{1}{\frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A}} \cot A = \frac{1}{\frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A}}$$

$$\cot A = \frac{\text{Base side adjacent to } \angle A}{\text{Perpendicular side opposite to } \angle A} \cot A = \frac{\text{Base side adjacent to } \angle A}{\text{Perpendicular side opposite to } \angle A} \dots (2)$$

Comparing (1) and (2)

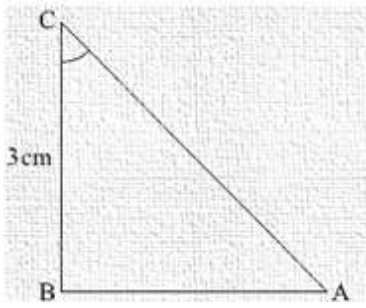

We get,

$$\text{Base side adjacent to } \angle A = 4$$

$$\text{Perpendicular side opposite to } \angle A = 3$$

Hence  $\triangle ABC$  is as shown in figure below

In  $\triangle ABC$ , Hypotenuse is unknown

Hence, it can be found by using Pythagoras theorem

Therefore by applying Pythagoras theorem in  $\triangle ABC$

We get

$$AC^2 = AB^2 + BC^2$$

Substituting the values of sides from the above figure

$$AC^2 = 4^2 + 3^2$$

$$AC^2 = 16 + 9$$

$$AC^2 = 25$$

$$AC = \sqrt{25} = 5$$

$$AC = 5$$

Hence, hypotenuse = 5

To check whether

$$\frac{1 - \tan^2 A}{1 + \tan^2 A} = \cos^2 A - \sin^2 A \quad \frac{1 - \tan^2 A}{1 + \tan^2 A} = \cos^2 A - \sin^2 A \text{ or not.}$$

We get three values of  $\tan A$ ,  $\cos A$ ,  $\sin A$

By definition,

$$\tan A = \frac{1}{\cot A}$$

Substituting the value of  $\cot A$  from equation (1)

We get,

$$\tan A = \frac{1}{\frac{1}{4}} = 4$$

$$\tan A = \frac{3}{4} \dots (3)$$

Now by definition,

$$\cos A = \frac{\text{Base side adjacent to } \angle A}{\text{Hypotenuse}} \quad \cos A = \frac{AB}{AC}$$

Substituting the values of sides from the above figure

$$\cos A = \frac{4}{5} \quad \dots (5)$$

$$\text{Now we first take L.H.S of equation } \frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A}$$

$$\text{L.H.S} = \frac{1 - \tan^2 A}{1 + \tan^2 A}$$

Substituting value of  $\tan A$  from equation (3)

We get,

$$\text{L.H.S} = \frac{1 - \left(\frac{3}{4}\right)^2}{1 + \left(\frac{3}{4}\right)^2}$$

$$\frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{1 - \left(\frac{3}{4}\right)^2}{1 + \left(\frac{3}{4}\right)^2}$$

$$\frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{1 - \frac{9}{16}}{1 + \frac{9}{16}}$$

Taking L.C.M on both numerator and denominator

We get,

$$\frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{16 - 9}{16 + 9}$$

$$\frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{7}{25} \quad \dots (6)$$

$$\text{Now we take R.H.S of equation whether } \frac{1 - \tan^2 A}{1 + \tan^2 A} = \frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A}$$

$$\text{R.H.S} = \frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A}$$

Substituting value of  $\sin A$  and  $\cos A$  from equation (4) and (5)

We get,

$$\text{R.H.S} = \left(\frac{4}{5}\right)^2 - \left(\frac{3}{5}\right)^2$$

$$\frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A} = \frac{\left(\frac{4}{5}\right)^2 - \left(\frac{3}{5}\right)^2}{\left(\frac{4}{5}\right)^2 + \left(\frac{3}{5}\right)^2}$$

$$\frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A} = \frac{16 - 9}{25 + 9}$$

$$\frac{\cos^2 A - \sin^2 A}{\cos^2 A + \sin^2 A} = \frac{7}{34}$$

$$\cos^2 A - \sin^2 A = \cos^2 A - \sin^2 A = 725 \frac{7}{25} \dots (7)$$

Comparing (6) and (7)

We get.

$$1 - \tan^2 A = \cos^2 A - \sin^2 A \frac{1 - \tan^2 A}{1 + \tan^2 A} = \cos^2 A - \sin^2 A$$

Answer:

$$\text{Yes, } 1 - \tan^2 A = \cos^2 A - \sin^2 A \frac{1 - \tan^2 A}{1 + \tan^2 A} = \cos^2 A - \sin^2 A$$

9.) If  $\tan \Theta = \frac{a}{b}$ , find the value of  $\frac{\cos \Theta + \sin \Theta}{\cos \Theta - \sin \Theta}$ .

Sol.

Given:

$$\tan \Theta = \frac{a}{b} \dots (1)$$

$$\text{Now, we know that } \tan \Theta = \frac{\sin \Theta}{\cos \Theta} \Rightarrow \sin \Theta = \cos \Theta \tan \Theta = \frac{\sin \Theta}{\cos \Theta}$$

Therefore equation (1) become as follows

$$\sin \Theta \cos \Theta = \frac{\sin \Theta}{\cos \Theta} = ab \frac{a}{b}$$

Now, by applying invertendo

We get,

$$\cos \Theta \sin \Theta = ba \frac{\cos \Theta}{\sin \Theta} = \frac{b}{a}$$

Now by applying Componendo – dividendo

We get,

$$\cos \Theta + \sin \Theta = b + ab - a \frac{\cos \Theta + \sin \Theta}{\cos \Theta - \sin \Theta} = \frac{b+a}{b-a}$$

Therefore,

$$\cos \Theta + \sin \Theta = b + ab - a \frac{\cos \Theta + \sin \Theta}{\cos \Theta - \sin \Theta} = \frac{b+a}{b-a}$$

10.) If  $3 \tan \Theta = 4$ , find the value of  $\frac{4 \cos \Theta - \sin \Theta}{2 \cos \Theta + \sin \Theta}$

Sol.

Given: If  $3\tan\Theta=4$   $\tan\Theta = \frac{4}{3}$

Therefore,

$$\tan\Theta = \frac{4}{3} \dots (1)$$

Now, we know that  $\tan\Theta = \frac{\sin\Theta}{\cos\Theta}$

Therefore equation (1) becomes

$$\sin\Theta = \frac{4}{3} \cos\Theta \dots (2)$$

Now, by applying Invertendo to equation (2)

We get,

$$\cos\Theta = \frac{3}{4} \sin\Theta \dots (3)$$

Now, multiplying by 4 on both sides

We get

$$4 \cos\Theta = 3 \sin\Theta$$

Therefore

$$4 \cos\Theta - \sin\Theta = 3 \sin\Theta$$

$$4 \cos\Theta - \sin\Theta = 2 \sin\Theta \dots (4)$$

Now, multiplying by 2 on both sides of equation (4)

We get,

$$2 \cos\Theta - \sin\Theta = \sin\Theta$$

Now by applying componendo in above equation

$$2 \cos\Theta + \sin\Theta = 2 \sin\Theta$$

$$2 \cos\Theta + \sin\Theta = 5 \sin\Theta \dots (5)$$

We get,

$$\frac{4 \cos\Theta - \sin\Theta}{2 \cos\Theta + \sin\Theta} = \frac{2 \sin\Theta}{5 \sin\Theta} = \frac{2}{5}$$

Therefore,

$$4 \cos\Theta - \sin\Theta = \frac{2}{5} (2 \cos\Theta + \sin\Theta)$$

Therefore, on L.H.S  $\sin\Theta\sin\Theta$  cancels and we get,

$$4\cos\Theta - \sin\Theta = 2 \times 25 \frac{4\cos\Theta - \sin\Theta}{2\cos\Theta + \sin\Theta} = \frac{2}{1} \times \frac{2}{5}$$

Therefore,

$$4\cos\Theta - \sin\Theta = 4\cos\Theta - \sin\Theta = 4$$

11.) If  $3\cot\Theta = 23 \cot\Theta = 2$ , find the value of  $4\sin\Theta - 3\cos\Theta$   $\frac{4\sin\Theta - 3\cos\Theta}{2\sin\Theta + 6\cos\Theta}$

**Sol.**

Given:

$$3\cot\Theta = 23 \cot\Theta = 2$$

Therefore,

$$\cot\Theta = 23 \cot\Theta = \frac{2}{3} \dots (1)$$

$$\text{Now, we know that } \cot\Theta = \frac{\cos\Theta}{\sin\Theta} \cot\Theta = \frac{\cos\Theta}{\sin\Theta}$$

Therefore equation (1) becomes

$$\cos\Theta \sin\Theta = 23 \frac{\cos\Theta}{\sin\Theta} = \frac{2}{3} \dots (2)$$

Now, by applying invertendo to equation (2)

$$\sin\Theta \cos\Theta = 32 \frac{\sin\Theta}{\cos\Theta} = \frac{3}{2} \dots (3)$$

Now, multiplying by  $43 \frac{4}{3}$  on both sides,

We get,

$$43 \times \sin\Theta \cos\Theta = 43 \times 32 \frac{4}{3} \times \frac{\sin\Theta}{\cos\Theta} = \frac{4}{3} \times \frac{3}{2}$$

Therefore, 3 cancels out on R.H.S and

We get,

$$4\sin\Theta 3\cos\Theta = 21 \frac{4\sin\Theta}{3\cos\Theta} = \frac{2}{1}$$

Now by applying invertendo dividendo in above equation

We get,

$$4\sin\Theta - 3\cos\Theta 3\cos\Theta = 2-11 \frac{4\sin\Theta - 3\cos\Theta}{3\cos\Theta} = \frac{2-1}{1}$$

$$4\sin\Theta - 3\cos\Theta \cdot 3\cos\Theta = 11 \frac{4\sin\Theta - 3\cos\Theta}{3\cos\Theta} = \frac{1}{1} \dots (4)$$

Now, multiplying by  $26 \frac{2}{6}$  on both sides of equation (3)

We get,

$$26 \times \sin\Theta \cos\Theta = 26 \times 32 \frac{2}{6} \times \frac{\sin\Theta}{\cos\Theta} = \frac{2}{6} \times \frac{3}{2}$$

Therefore, 2 cancels out on R.H.S and

We get,

$$2\sin\Theta 6\cos\Theta = 36 \frac{2\sin\Theta}{6\cos\Theta} = \frac{3}{6} \quad 2\sin\Theta 6\cos\Theta = 12 \frac{2\sin\Theta}{6\cos\Theta} = \frac{1}{2}$$

Now by applying componendo in above equation

We get,

$$2\cos\Theta + 6\sin\Theta \cdot 6\sin\Theta = 1 + 22 \frac{2\cos\Theta + 6\sin\Theta}{6\sin\Theta} = \frac{1+2}{2}$$

$$2\cos\Theta + 6\sin\Theta \cdot 6\sin\Theta = 32 \frac{2\cos\Theta + 6\sin\Theta}{6\sin\Theta} = \frac{3}{2} \dots (5)$$

Now, by dividing equation (4) by (5)

We get,

$$4\sin\Theta - 3\cos\Theta \cdot 3\sin\Theta \cdot 2\cos\Theta + 6\sin\Theta \cdot 6\sin\Theta = 11 \cdot 32 \frac{\frac{4\sin\Theta - 3\cos\Theta}{3\sin\Theta}}{\frac{2\cos\Theta + 6\sin\Theta}{6\sin\Theta}} = \frac{1}{\frac{3}{2}}$$

Therefore,

$$4\sin\Theta - 3\cos\Theta \cdot 3\sin\Theta \times 6\sin\Theta \cdot 2\cos\Theta + 6\sin\Theta = 11 \times 23 \frac{4\sin\Theta - 3\cos\Theta}{3\sin\Theta} \times \frac{6\sin\Theta}{2\cos\Theta + 6\sin\Theta} = \frac{1}{1} \times \frac{2}{3} \quad 4\sin\Theta -$$

$$3\cos\Theta \cdot 3\sin\Theta \times 2 \times 3\sin\Theta \cdot 2\cos\Theta + 6\sin\Theta = 11 \times 23 \frac{4\sin\Theta - 3\cos\Theta}{3\sin\Theta} \times \frac{2 \times 3\sin\Theta}{2\cos\Theta + 6\sin\Theta} = \frac{1}{1} \times \frac{2}{3}$$

Therefore, on L.H.S ( $3\sin\Theta \sin\Theta$ ) cancels out and we get,

$$2 \times 4\sin\Theta - 3\cos\Theta \cdot 2\cos\Theta + 6\sin\Theta = 11 \times 23 \frac{2 \times 4\sin\Theta - 3\cos\Theta}{2\cos\Theta + 6\sin\Theta} = \frac{1}{1} \times \frac{2}{3}$$

Now, by taking 2 in the numerator of L.H.S on the R.H.S

We get,

$$4\sin\Theta - 3\cos\Theta \cdot 2\cos\Theta + 6\sin\Theta = 23 \times 2 \frac{4\sin\Theta - 3\cos\Theta}{2\cos\Theta + 6\sin\Theta} = \frac{2}{3 \times 2}$$

Therefore, 2 cancels out on R.H.S and

We get,

$$4\sin\Theta - 3\cos\Theta \cdot 2\cos\Theta + 6\sin\Theta = 13 \frac{4\sin\Theta - 3\cos\Theta}{2\cos\Theta + 6\sin\Theta} = \frac{1}{3}$$

Hence answer,

$$4\sin\theta - 3\cos\theta = 2\cos\theta + 6\sin\theta = 13 \frac{4\sin\theta - 3\cos\theta}{2\cos\theta + 6\sin\theta} = \frac{1}{3}$$

12.) If  $\tan\theta = \frac{a}{b}$ , prove that  $a\sin\theta - b\cos\theta = \frac{a^2 - b^2}{a^2 + b^2}$

$$\frac{a\sin\theta - b\cos\theta}{a\sin\theta + b\cos\theta} = \frac{a^2 - b^2}{a^2 + b^2}$$

**Sol.**

Given:

$$\tan\theta = \frac{a}{b} \dots (1)$$

$$\text{Now, we know that } \tan\theta = \frac{\sin\theta}{\cos\theta} \Rightarrow \sin\theta = \cos\theta \tan\theta = \frac{\sin\theta}{\cos\theta}$$

Therefore equation (1) becomes

$$\sin\theta = \cos\theta \times \frac{a}{b} \dots (2)$$

Now, by multiplying by  $\frac{a}{b}$  on both sides of equation (2)

We get,

$$a \times \sin\theta = a \times \cos\theta \times \frac{a}{b} = \frac{a^2}{b} \times \frac{\sin\theta}{\cos\theta}$$

Therefore,

$$a\sin\theta = \frac{a^2}{b} \times \frac{\sin\theta}{\cos\theta} \dots (3)$$

Now by applying dividendo in above equation (3)

We get,

$$a\sin\theta - b\cos\theta = \frac{a^2 - b^2}{b} \times \frac{\sin\theta}{\cos\theta} \dots (4)$$

Now by applying componendo in equation (3)

We get,

$$a\sin\theta + b\cos\theta = \frac{a^2 + b^2}{b} \times \frac{\sin\theta}{\cos\theta} \dots (5)$$

Now, by dividing equation (4) by equation (5)

We get,

$$\frac{a\sin\theta - b\cos\theta}{a\sin\theta + b\cos\theta} = \frac{\frac{a^2 - b^2}{b} \times \frac{\sin\theta}{\cos\theta}}{\frac{a^2 + b^2}{b} \times \frac{\sin\theta}{\cos\theta}} = \frac{a^2 - b^2}{a^2 + b^2}$$

Therefore,

$$\frac{a \sin \theta - b \cos \theta}{b \cos \theta} \times \frac{b \cos \theta}{a \sin \theta + b \cos \theta} = \frac{a^2 - b^2}{b^2} \times \frac{b^2}{a^2 + b^2}$$

Therefore,  $b \cos \theta$  and  $b^2$  cancels on L.H.S and R.H.S respectively

$$\frac{a \sin \theta - b \cos \theta}{a \sin \theta + b \cos \theta} = \frac{a^2 - b^2}{a^2 + b^2}$$

Hence, it is proved that

$$\frac{a \sin \theta - b \cos \theta}{a \sin \theta + b \cos \theta} = \frac{a^2 - b^2}{a^2 + b^2}$$

13.) If  $\sec \theta = \frac{13}{5}$ , show that  $\frac{2 \sin \theta - 3 \cos \theta}{4 \sin \theta - 9 \cos \theta} = 3$

Sol.

Given:

$$\sec \theta = \frac{13}{5}$$

To show that  $\frac{2 \sin \theta - 3 \cos \theta}{4 \sin \theta - 9 \cos \theta} = 3$

$$\cos \theta = \frac{1}{\sec \theta} = \frac{5}{13}$$

Therefore,

$$\sin \theta = \frac{12}{13}$$

Therefore,

$$\cos \theta = \frac{5}{13} \dots (1)$$

Now, we know that

$$\cos \theta = \frac{\text{Base side adjacent to } \angle \theta}{\text{Hypotenuse}} = \frac{\text{Base side adjacent to } \angle \theta}{\text{Hypotenuse}}$$

Now, by comparing equation (1) and (2)

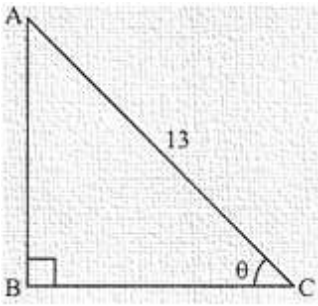

We get,

$$\text{Base side adjacent to } \angle \theta = 5$$

And

$$\text{Hypotenuse} = 13$$

Therefore from above figure

Base side  $BC = 5$

Hypotenuse  $AC = 13$

Side  $AB$  is unknown. It can be determined by using Pythagoras theorem

Therefore by applying Pythagoras theorem

We get,

$$AC^2 = AB^2 + BC^2$$

Therefore by substituting the values of known sides

We get,

$$13^2 = AB^2 + 5^2$$

Therefore,

$$AB^2 = 13^2 - 5^2$$

$$AB^2 = 169 - 25$$

$$AB^2 = 144$$

$$AB = \sqrt{144} = 12$$

Therefore,

$$AB = 12 \dots (3)$$

Now, we know that

$$\sin \theta = \frac{AB}{AC} \sin \theta = \frac{AB}{AC}$$

$$\sin \theta = \frac{12}{13} \sin \theta = \frac{12}{13} \dots (4)$$

Now L.H.S of the equation to be proved is as follows

$$\text{L.H.S} = 2 \sin \theta - 3 \tan \theta + 4 \sin \theta - 3 \cos \theta = \frac{2 \sin \theta - 3 \tan \theta}{4 \sin \theta - 3 \cos \theta}$$

Substituting the value  $\cos\Theta$  of  $\sin\Theta$  and from equation (1) and (4) respectively

We get,

$$2 \times \frac{12}{13} - 3 \times \frac{5}{13} = \frac{2 \times \frac{12}{13} - 3 \times \frac{5}{13}}{4 \times \frac{12}{13} - 9 \times \frac{5}{13}}$$

Therefore,

$$\text{L.H.S} = 2 \times 12 - 3 \times 5 = \frac{2 \times 12 - 3 \times 5}{4 \times 12 - 9 \times 5}$$

$$\text{L.H.S} = 24 - 15 = \frac{24 - 15}{48 - 45}$$

$$\text{L.H.S} = \frac{9}{3}$$

$$\text{L.H.S} = 3$$

Hence proved that,

$$2 \sin\Theta - 3 \tan\Theta = \frac{2 \sin\Theta - 3 \tan\Theta}{4 \sin\Theta - 3 \cos\Theta} = 3$$

14.) If  $\cos\Theta = \frac{12}{13}$ , show that  $\sin\Theta(1 - \tan\Theta) = \frac{35}{156}$

Sol.

$$\text{Given: } \cos\Theta = \frac{12}{13} \dots (1)$$

$$\text{To show that } \sin\Theta(1 - \tan\Theta) = \frac{35}{156}$$

$$\text{Now we know that } \cos\Theta = \frac{\text{Base side adjacent to } \angle\Theta}{\text{Hypotenuse}} = \frac{\text{Base side adjacent to } \angle\Theta}{\text{Hypotenuse}} \dots (2)$$

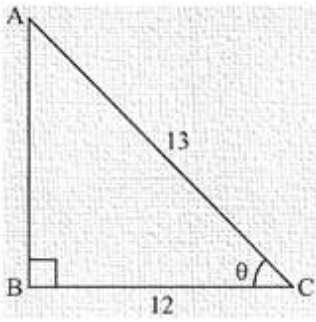

Therefore, by comparing equation (1) and (2)

We get,

$$\text{Base side adjacent to } \angle\Theta = 12$$

And

$$\text{Hypotenuse} = 13$$

Therefore from above figure

Base side BC= 12

Hypotenuse AC= 13

Side AB is unknown and it can be determined by using Pythagoras theorem

Therefore by applying Pythagoras theorem

We get,

$$AC^2 = AB^2 + BC^2$$

Therefore by substituting the values of known sides

We get,

$$13^2 = AB^2 + 12^2$$

Therefore,

$$AB^2 = 13^2 - 12^2$$

$$AB^2 = 169 - 144$$

$$AB = 25$$

$$AB = \sqrt{25} \sqrt{25}$$

Therefore,

$$AB = 5 \dots (3)$$

Now, we know that

$$\sin \theta = \frac{\text{Perpendicular side opposite to } \angle \theta}{\text{Hypotenuse}} \quad \sin \theta = \frac{\text{Perpendicular side opposite to } \angle \theta}{\text{Hypotenuse}}$$

Now from figure (a)

We get,

$$\sin \theta = \frac{AB}{AC} \quad \sin \theta = \frac{AB}{AC}$$

Therefore,

$$\sin \Theta = \frac{5}{12} \sin \Theta = \frac{5}{12} \dots (5)$$

Now L.H.S of the equation to be proved is as follows

L.H.S of the equation to be proved is as follows

$$\text{L.H.S} = \sin \Theta (1 - \tan \Theta) \sin \Theta (1 - \tan \Theta) \dots (6)$$

Substituting the value of  $\sin \Theta$  and  $\tan \Theta$  from equation (4) and (5)

We get,

$$\text{L.H.S} = \frac{5}{12} (1 - \frac{5}{12}) \frac{5}{12} (1 - \frac{5}{12})$$

Taking L.C.M inside the bracket

We get,

$$\text{L.H.S} = \frac{5}{12} (12 - 5) \frac{5}{12} (\frac{12 - 5}{12})$$

Therefore,

$$\text{L.H.S} = \frac{5}{12} (7) \frac{5}{12} (\frac{7}{12})$$

$$\text{L.H.S} = \frac{5}{12} (7) \frac{5}{12} (\frac{7}{12})$$

Now by opening the bracket and simplifying

We get,

$$\text{L.H.S} = \frac{5 \times 7 \times 5 \times 7}{12 \times 12}$$

$$\text{L.H.S} = \frac{35}{12}$$

From equation (6) and (7), it can be shown that

$$\text{that } \sin \Theta (1 - \tan \Theta) \sin \Theta (1 - \tan \Theta) = \frac{35}{12}$$

$$15.) \text{ If } \cot \Theta = \frac{1}{\sqrt{3}}, \text{ show that } 1 - \cos^2 \Theta - \sin^2 \Theta = \frac{3}{5}$$

Sol.

$$\text{Given: } \cot \Theta = \frac{1}{\sqrt{3}} \dots (1)$$

$$\text{To show that } 1 - \cos^2 \Theta - \sin^2 \Theta = \frac{3}{5}$$

$$\text{Now, we know that } \cot \Theta = \frac{1}{\tan \Theta}$$

$$\text{Since } \tan \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta}$$

Therefore,

$$\tan \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta} \quad \tan \Theta = \frac{1}{\frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta}}$$

Therefore,

$$\cot \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Perpendicular side opposite to } \angle \Theta} \quad \cot \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Perpendicular side opposite to } \angle \Theta} \quad \dots (2)$$

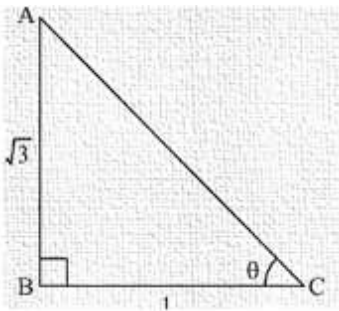

Comparing Equation (1) and (2)

We get.

$$\text{Base side adjacent to } \angle \Theta = 1$$

$$\text{Perpendicular side opposite to } \angle \Theta = \sqrt{3}$$

Therefore, triangle representing angle  $\sqrt{3}$  is as shown below

Therefore, by substituting the values of known sides

We get,

$$AC^2 = (\sqrt{3})^2 + 1^2$$

Therefore,

$$AC^2 = 3 + 1$$

$$AC^2 = 4$$

$$AC = \sqrt{4}$$

Therefore,

$$AC = 2 \quad \dots (3)$$

Now, we know that

$$\sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} \quad \sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}}$$

Now from figure (a)

$$\sin \Theta = \frac{AB}{AC} \sin \Theta = \frac{AB}{AC}$$

Therefore from figure (a) and equation (3),

$$\sin \Theta = \frac{\sqrt{3}}{2} \sin \Theta = \frac{\sqrt{3}}{2}$$

Now we know that

$$\cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}} = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}}$$

Now from figure (a)

We get,

$$\cos \Theta = \frac{BC}{AC}$$

Therefore from figure (a) and equation (3),

$$\cos \Theta = \frac{1}{2} \cos \Theta = \frac{1}{2} \dots (5)$$

Now, L.H.S of the equation to be proved is as follows

$$\text{L.H.S} = \frac{1 - \cos^2 \Theta}{2 - \sin^2 \Theta} = \frac{1 - \cos^2 \Theta}{2 - \sin^2 \Theta}$$

Substituting the value of from equation (4) and (5)

We get,

$$\text{L.H.S} = \frac{1 - \left(\frac{1}{2}\right)^2}{2 - \left(\frac{\sqrt{3}}{2}\right)^2}$$

$$\text{L.H.S} = \frac{1 - \frac{1}{4}}{2 - \frac{3}{4}}$$

Now by taking L.C.M in numerator as well as denominator

We get,

$$\text{L.H.S} = \frac{(4 \times 1) - 1}{(4 \times 1) - 14} \frac{(4 \times 2) - 3}{(4 \times 2) - 3} = \frac{4 - 1}{4} \frac{8 - 3}{8 - 3}$$

Therefore,

$$\text{L.H.S} = \frac{4 - 1}{4} \frac{8 - 3}{8 - 3} = \frac{3}{4} \times \frac{4}{4}$$

$$\text{L.H.S} = 3 \times \frac{3}{4} = \frac{3}{4} \times \frac{4}{4}$$

$$\text{L.H.S} = 3 \times \frac{3}{4} = \frac{3}{4} = \text{R.H.S}$$

Therefore,

$$1 - \cos^2 \theta = \sin^2 \theta = 35 \frac{1 - \cos^2 \theta}{2 - \sin^2 \theta} = \frac{3}{5}$$

16.) If  $\tan \theta = \frac{1}{\sqrt{7}}$ , then show that  $\frac{\operatorname{cosec}^2 \theta - \sec^2 \theta}{\operatorname{cosec}^2 \theta + \sec^2 \theta} = 34 \frac{3}{4}$

Sol.

Given:  $\tan \theta = \frac{1}{\sqrt{7}}$  .... (1)

To show that  $\frac{\operatorname{cosec}^2 \theta - \sec^2 \theta}{\operatorname{cosec}^2 \theta + \sec^2 \theta} = 34 \frac{3}{4}$

Now, we know that

Since,  $\tan \theta = \frac{\text{Perpendicular side opposite to } \angle \theta}{\text{Base side adjacent to } \angle \theta}$  .... (2)

Therefore,

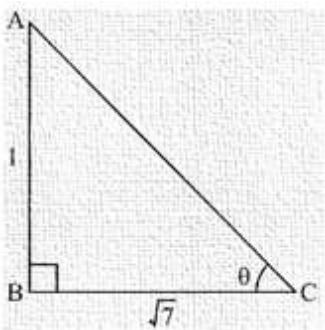

Comparing equation (1) and (2)

We get.

Perpendicular side opposite to  $\angle \theta = 1$

Base side adjacent to  $\angle \theta = \sqrt{7}$

Therefore, Triangle representing  $\angle \theta$  is shown below

Hypotenuse AC is unknown and it can be found by using Pythagoras theorem

Therefore by applying Pythagoras theorem

We get,

$$AC^2 = AB^2 + BC^2$$

Therefore by substituting the values of known sides

We get,

$$AC^2 = (1)^2 + (\sqrt{7})^2 + (\sqrt{7})^2$$

Therefore,

$$AC^2 = 1 + 7$$

$$AC^2 = 8$$

$$AC = \sqrt{8} \sqrt{8}$$

$$AC = \sqrt{2 \times 2 \times 2} \sqrt{2 \times 2 \times 2}$$

Therefore,

$$AC = 2\sqrt{2} \sqrt{2} \dots (3)$$

Now we know that

$$\sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} \quad \sin \Theta = \frac{AB}{AC}$$

$$\sin \Theta = \frac{AB}{AC}$$

$$\sin \Theta = \frac{1}{2\sqrt{2}} \quad \dots (4)$$

$$\text{Now, we know that } \operatorname{cosec} \Theta = \frac{1}{\sin \Theta}$$

Therefore, from equation (4)

We get,

$$\operatorname{cosec} \Theta = 2\sqrt{2} \quad \dots (5)$$

Now, we know that

$$\cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}} \quad \cos \Theta = \frac{BC}{AC}$$

Now from figure (a)

We get,

$$\cos \Theta = \frac{BC}{AC}$$

Therefore from figure (a) and equation (3)

$$\cos \Theta = \frac{\sqrt{7}}{2\sqrt{2}} \quad \dots (6)$$

$$\text{Now we know that } \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore, from equation (6)

We get,

$$\sec\Theta = \frac{1}{\frac{\sqrt{7}}{2\sqrt{2}}} = \frac{2\sqrt{2}}{\sqrt{7}}$$

$$\sec\Theta = 2\sqrt{2}\sqrt{7} \sec\Theta = \frac{2\sqrt{2}}{\sqrt{7}} \dots (7)$$

Now, L.H.S of the equation to be proved is as follows

$$\text{L.H.S} = \frac{\operatorname{cosec}^2\Theta - \sec^2\Theta}{\operatorname{cosec}^2\Theta + \sec^2\Theta}$$

Substituting the value of  $\operatorname{cosec}\Theta$  and  $\sec\Theta$  from equation (6) and (7)

We get,

$$\text{L.H.S} = \frac{[(2\sqrt{2})^2 - (\frac{2\sqrt{2}}{\sqrt{7}})^2]}{[(2\sqrt{2})^2 + (\frac{2\sqrt{2}}{\sqrt{7}})^2]}$$

$$\text{L.H.S} = \frac{(8) - (\frac{8}{7})}{(8) + (\frac{8}{7})}$$

Therefore,

$$\frac{56-8}{56+8} = \frac{\frac{56-8}{7}}{\frac{56+8}{7}}$$

$$\text{L.H.S} = \frac{48}{64}$$

Therefore,

$$\text{L.H.S} = \frac{48}{64}$$

$$\text{L.H.S} = 34 \frac{3}{4} = \text{R.H.S}$$

Therefore,

$$\frac{\operatorname{cosec}^2\Theta - \sec^2\Theta}{\operatorname{cosec}^2\Theta + \sec^2\Theta} = 34 \frac{3}{4}$$

Hence proved that

$$\frac{\operatorname{cosec}^2\Theta - \sec^2\Theta}{\operatorname{cosec}^2\Theta + \sec^2\Theta} = 34 \frac{3}{4}$$

17.) If  $\sec\Theta = 54 \sec\Theta = \frac{5}{4}$ , find the value of  $\frac{\sin\Theta - 2\cos\Theta}{\tan\Theta - \cot\Theta}$

Sol.

$$\text{Given: } \sec\Theta = 54 \sec \Theta = \frac{5}{4} \dots (1)$$

To find the value of  $\frac{\sin\Theta - 2\cos\Theta \tan\Theta - \cot\Theta}{\tan\Theta - \cot\Theta}$

$$\text{Now we know that } \sec\Theta = \frac{1}{\cos\Theta} \sec \Theta = \frac{1}{\cos \Theta}$$

Therefore,

$$\cos\Theta = \frac{1}{\sec\Theta} \cos \Theta = \frac{1}{\sec \Theta}$$

Therefore from equation (1)

$$\cos\Theta = \frac{1}{54} \cos \Theta = \frac{1}{54}$$

$$\cos\Theta = \frac{4}{5} \cos \Theta = \frac{4}{5} \dots (2)$$

$$\text{Also, we know that } \cos^2\Theta + \sin^2\Theta = 1 \cos^2 \Theta + \sin^2 \Theta = 1$$

Therefore,

$$\sin^2\Theta = 1 - \cos^2\Theta \sin^2 \Theta = 1 - \cos^2 \Theta \quad \sin\Theta = \sqrt{1 - \cos^2\Theta} \sin \Theta = \sqrt{1 - \cos^2 \Theta}$$

Substituting the value of  $\cos\Theta$  from equation (2)

We get,

$$\sin\Theta = \sqrt{1 - \left(\frac{4}{5}\right)^2} \sin \Theta = \sqrt{1 - \left(\frac{4}{5}\right)^2}$$

$$= \sqrt{1 - \frac{16}{25}} \sqrt{1 - \frac{16}{25}}$$

$$= \frac{9}{25}$$

$$= 35 \frac{3}{5}$$

Therefore,

$$\sin\Theta = \frac{3}{5} \sin \Theta = \frac{3}{5} \dots (3)$$

Also, we know that

$$\sec^2\Theta = 1 + \tan^2\Theta \sec^2 \Theta = 1 + \tan^2 \Theta$$

Therefore,

$$\tan^2\Theta = \left(\frac{54}{4}\right)^2 - 1 \tan^2 \Theta = \left(\frac{5}{4}\right)^2 - 1 \quad \tan\Theta = \left(\sqrt{916}\right) \tan \Theta = \left(\sqrt{\frac{9}{16}}\right)$$

Therefore,

$$\tan \Theta = \frac{3}{4} \dots (4)$$

$$\text{Also, } \cot \Theta = \frac{1}{\tan \Theta} = \frac{4}{3}$$

Therefore from equation (4)

We get,

$$\cot \Theta = \frac{4}{3} \dots (5)$$

Substituting the value of  $\cos \Theta$ ,  $\cot \Theta$  and  $\tan \Theta$  from the equation (2),(3),(4) and (5) respectively in the expression below

$$\sin \Theta - 2 \cos \Theta \tan \Theta - \cot \Theta \frac{\sin \Theta - 2 \cos \Theta}{\tan \Theta - \cot \Theta}$$

We get,

$$\begin{aligned} \sin \Theta - 2 \cos \Theta \tan \Theta - \cot \Theta \frac{\sin \Theta - 2 \cos \Theta}{\tan \Theta - \cot \Theta} &= \frac{\frac{3}{5} - 2(\frac{4}{5})}{\frac{3}{4} - \frac{4}{3}} \\ &= 127 \frac{12}{7} \end{aligned}$$

$$\text{Therefore, } \sin \Theta - 2 \cos \Theta \tan \Theta - \cot \Theta \frac{\sin \Theta - 2 \cos \Theta}{\tan \Theta - \cot \Theta} = 127 \frac{12}{7}$$

18.) If  $\sin \Theta = \frac{12}{13}$ , find the value of  $\frac{2 \sin \Theta \cos \Theta}{\cos^2 \Theta - \sin^2 \Theta}$

Sol.

$$\text{Given: } \sin \Theta = \frac{12}{13} \dots (1)$$

$$\text{To, find the value of } \frac{2 \sin \Theta \cos \Theta}{\cos^2 \Theta - \sin^2 \Theta}$$

Now, we know the following trigonometric identity

$$\operatorname{cosec}^2 \Theta = 1 + \tan^2 \Theta$$

Therefore, by substituting the value of  $\tan \Theta$  from equation (1)

We get,

$$\operatorname{cosec}^2 \Theta = 1 + \left(\frac{12}{13}\right)^2$$

$$= 1 + \frac{12^2}{13^2}$$

$$= 1 + \frac{144}{169}$$

By taking L.C.M on the R.H.S

We get,

$$\begin{aligned}\operatorname{cosec}^2\Theta &= 169+144 \operatorname{cosec}^2\Theta = \frac{169+144}{169} \\ &= 313 \operatorname{cosec}^2\Theta = \frac{313}{169}\end{aligned}$$

Therefore

$$\begin{aligned}\operatorname{cosec}\Theta &= \sqrt{313} \operatorname{cosec}\Theta = \sqrt{\frac{313}{169}} \\ &= \operatorname{cosec}\Theta = \sqrt{313} \operatorname{cosec}\Theta = \frac{\sqrt{313}}{13}\end{aligned}$$

Therefore

$$\operatorname{cosec}\Theta \operatorname{cosec}\Theta = \operatorname{cosec}\Theta \operatorname{cosec}\Theta = \frac{\sqrt{313}}{13} \dots (2)$$

Now, we know that

$$\begin{aligned}\operatorname{cosec}\Theta \operatorname{cosec}\Theta &= \frac{1}{\sin\Theta} \frac{1}{\sin\Theta} \\ \sin\Theta &= \frac{1}{\sqrt{313} \operatorname{cosec}\Theta} = \frac{1}{\frac{\sqrt{313}}{13}}\end{aligned}$$

Therefore

$$\sin\Theta = 13\sqrt{313} \sin\Theta = \frac{13}{\sqrt{313}} \dots (3)$$

Now, we know the following trigonometric identity

$$\cos^2\Theta + \sin^2\Theta = 1 \cos^2\Theta + \sin^2\Theta = 1$$

Therefore,

$$\cos^2\Theta = 1 - \sin^2\Theta \cos^2\Theta = 1 - \sin^2\Theta$$

Now by substituting the value of  $\sin\Theta$  from equation (3)

We get,

$$\begin{aligned}\cos^2\Theta &= 1 - \left(13\sqrt{313}\right)^2 \cos^2\Theta = 1 - \left(\frac{13}{\sqrt{313}}\right)^2 \\ &= 1 - 169 \cos^2\Theta = 1 - \frac{169}{313}\end{aligned}$$

Therefore, by taking L.C.M on R.H.S

We get,

$$\cos^2 \Theta = 144313 \cos^2 \Theta = \frac{144}{313}$$

Now, by taking square root on both sides

We get,

$$\cos \Theta = 12\sqrt{313} \cos \Theta = \frac{12}{\sqrt{313}}$$

Therefore,

$$\cos \Theta = 12\sqrt{313} \cos \Theta = \frac{12}{\sqrt{313}} \dots (4)$$

Substituting the value of  $\sin \Theta \sin \Theta$  and  $\cos \Theta \cos \Theta$  from equation (3) and (4) respectively in the equation below

$$2\sin \Theta \cos \Theta \cos^2 \Theta - \sin^2 \Theta \frac{2 \sin \Theta \cos \Theta}{\cos^2 \Theta - \sin^2 \Theta}$$

Therefore,

$$2\sin \Theta \cos \Theta \cos^2 \Theta - \sin^2 \Theta \frac{2 \sin \Theta \cos \Theta}{\cos^2 \Theta - \sin^2 \Theta} = 2 \times 13\sqrt{313} \times 12\sqrt{313} (13\sqrt{313})^2 - (12\sqrt{313})^2 \frac{2 \times \frac{13}{\sqrt{313}} \times \frac{12}{\sqrt{313}}}{\left(\frac{13}{\sqrt{313}}\right)^2 - \left(\frac{12}{\sqrt{313}}\right)^2}$$

$$= 312313 \frac{312}{25} \frac{313}{313}$$

$$31225 \frac{312}{25}$$

Therefore

$$2\sin \Theta \cos \Theta \cos^2 \Theta - \sin^2 \Theta \frac{2 \sin \Theta \cos \Theta}{\cos^2 \Theta - \sin^2 \Theta} =$$

$$31225 \frac{312}{25}$$

19.) If  $\cos \Theta = 35 \cos \Theta = \frac{3}{5}$ , find the value of  $\sin \Theta - \frac{1}{\tan \Theta} \frac{2 \tan \Theta}{2 \tan \Theta}$

Sol.

$$\text{Given: } \cos \Theta = 35 \cos \Theta = \frac{3}{5} \dots (1)$$

$$\text{To find the value of } \sin \Theta - \frac{1}{\tan \Theta} \frac{2 \tan \Theta}{2 \tan \Theta}$$

Now we know the following trigonometric identity

$$\cos^2 \Theta + \sin^2 \Theta = 1 \cos^2 \Theta + \sin^2 \Theta = 1$$

Therefore by substituting the value of  $\cos \Theta \cos \Theta$  from equation (1)

We get,

$$(3/5)^2 + \sin^2 \Theta = 1 \Rightarrow \sin^2 \Theta = 1 - (3/5)^2 = 16/25$$

Therefore,

$$\sin^2 \Theta = 1 - (3/5)^2 \Rightarrow \sin^2 \Theta = 1 - 9/25 \Rightarrow \sin^2 \Theta = 16/25$$

Therefore by taking square root on both sides

We get,

$$\sin \Theta = 4/5 \dots (2)$$

Now, we know that

$$\tan \Theta = \frac{\sin \Theta}{\cos \Theta}$$

Therefore by substituting the value of  $\sin \Theta$  and  $\cos \Theta$  from equation (2) and (1) respectively

We get,

$$\tan \Theta = \frac{4/5}{3/5} = 4/3 \dots (4)$$

Now, by substituting the value of  $\sin \Theta$  and of  $\tan \Theta$  from equation (2) and equation (4) respectively in the expression below

$$\sin \Theta - \frac{1}{2 \tan \Theta}$$

We get,

$$\sin \Theta - \frac{1}{2 \tan \Theta} = \frac{4}{5} - \frac{1}{2 \times \frac{4}{3}}$$

$$\sin \Theta - \frac{1}{2 \tan \Theta} = \frac{16}{20} - \frac{15}{20} = \frac{1}{20}$$

$$\sin \Theta - \frac{1}{2 \tan \Theta} = \frac{3}{160}$$

Therefore,

$$\sin \Theta - \frac{1}{2 \tan \Theta} = \frac{3}{160}$$

20.) If  $\sin \Theta = 3/5$ , find the value of  $\cos \Theta - \frac{1}{2 \cot \Theta}$

Sol.

**Given:**

$$\sin\Theta = 35 \sin \Theta = \frac{3}{5} \dots (1)$$

To find the value of  $\cos\Theta = \frac{1}{\tan\Theta} = \frac{1}{\frac{3}{5}} = \frac{5}{3}$

Now, we know the following trigonometric identity

$$\cos^2\Theta + \sin^2\Theta = 1 \quad \cos^2 \Theta + \sin^2 \Theta = 1$$

Therefore by substituting the value of  $\cos\Theta$  from equation (1)

We get,

$$\cos^2\Theta + \left(\frac{3}{5}\right)^2 = 1 \quad \cos^2 \Theta + \left(\frac{3}{5}\right)^2 = 1$$

Therefore,

$$\cos^2\Theta = 1 - \left(\frac{3}{5}\right)^2 \cos^2 \Theta = 1 - \left(\frac{3}{5}\right)^2 \quad \cos^2\Theta = 1 - \frac{9}{25} \cos^2 \Theta = 1 - \frac{9}{25}$$

Now by taking L.C.M

We get,

$$\cos^2\Theta = \frac{25-9}{25} \cos^2 \Theta = \frac{25-9}{25} \quad \cos^2\Theta = \frac{25-9}{25} \cos^2 \Theta = \frac{25-9}{25}$$

Therefore, by taking square roots on both sides

We get,

$$\cos\Theta = \frac{4}{5} \cos \Theta = \frac{4}{5}$$

Therefore,

$$\cos\Theta = \frac{4}{5} \cos \Theta = \frac{4}{5} \dots (2)$$

Now we know that

$$\tan\Theta = \frac{\sin\Theta}{\cos\Theta} \tan \Theta = \frac{\sin \Theta}{\cos \Theta}$$

Therefore by substituting the value of  $\sin\Theta$  and  $\cos\Theta$  from equation (1) and (2) respectively

We get,

$$\tan\Theta = \frac{3}{5} \tan \Theta = \frac{3}{5}$$

$$\tan\Theta = \frac{3}{4} \tan \Theta = \frac{3}{4} \dots (3)$$

Also, we know that

$$\cot \Theta = \frac{1}{\tan \Theta}$$

Therefore from equation (3)

We get,

$$\cot \Theta = \frac{1}{\frac{3}{4}}$$

$$\cot \Theta = \frac{4}{3} \dots (4)$$

Now by substituting the value of  $\cos \Theta$ ,  $\tan \Theta$  and  $\cot \Theta$  from equation (2), (3) and (4) respectively from the expression below

$$\cos \Theta - \frac{1}{2 \cot \Theta}$$

We get,

$$\cos \Theta - \frac{1}{2 \cot \Theta} = \frac{4}{5} - \frac{1}{2 \times \frac{4}{3}}$$

$$\cos \Theta - \frac{1}{2 \cot \Theta} = \frac{12}{15} - \frac{20}{15}$$

$$= \frac{-8}{15}$$

$$= -15 \frac{-1}{5}$$

Therefore,  $\cos \Theta - \frac{1}{2 \cot \Theta} = -15 \frac{-1}{5}$

21.) If  $\tan \Theta = \frac{24}{7}$ , find that  $\sin \Theta + \cos \Theta$

Sol.

Given:

$$\tan \Theta = \frac{24}{7} \dots (1)$$

To find,

$$\sin \Theta + \cos \Theta$$

Now we know that  $\tan \Theta$  is defined as follows

$$\tan \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta} \dots (2)$$

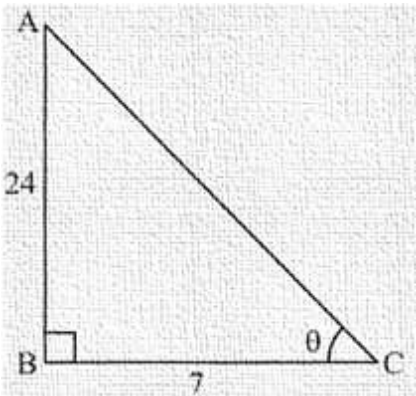

Now by comparing equation (1) and (2)

We get,

Perpendicular side opposite to  $\angle \Theta$  = 24

Base side adjacent to  $\angle \Theta$  = 7

Therefore triangle representing  $\angle \Theta$  is as shown below

Side AC is unknown and can be found by using Pythagoras theorem

Therefore,

$$AC^2 = AB^2 + BC^2$$

Now by substituting the value of unknown sides from figure

We get,

$$AC^2 = 24^2 + 7^2$$

$$AC = 576 + 49$$

$$AC = 625$$

Now by taking square root on both sides,

We get,

$$AC = 25$$

Therefore Hypotenuse

Hypotenuse side AC = 25 .... (3)

Now we know  $\sin \Theta$  is defined as follows

$$\sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}}$$

Therefore from figure (a) and equation (3)

We get,

$$\sin \Theta = \frac{AB}{AC} \sin \Theta = \frac{AB}{AC}$$

$$\sin \Theta = \frac{24}{25} \sin \Theta = \frac{24}{25} \dots (4)$$

Now we know that  $\cos \Theta$  is defined as follows

$$\cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}}$$

Therefore by substituting the value of  $\sin \Theta$  and  $\cos \Theta$  from equation (4) and (5) respectively, we get

$$\sin \Theta + \cos \Theta = \frac{24}{25} + \frac{7}{25}$$

$$\sin \Theta + \cos \Theta = \frac{31}{25}$$

$$\text{Hence, } \sin \Theta + \cos \Theta = \frac{31}{25}$$

22.) If  $\sin \Theta = \frac{a}{b}$ , find  $\sec \Theta + \tan \Theta$  in terms of a and b.

Sol.

Given:

$$\sin \Theta = \frac{a}{b} \dots (1)$$

To find:  $\sec \Theta + \tan \Theta$

Now we know,  $\sin \Theta$  is defined as follows

$$\sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} \sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} \dots (2)$$

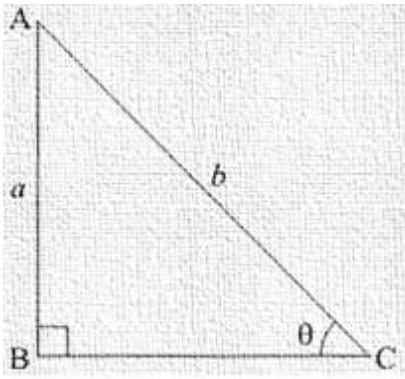

Now by comparing equation (1) and (2)

We get,

$$\text{Perpendicular side opposite to } \angle \Theta = a$$

$$\text{Hypotenuse} = b$$

Therefore triangle representing  $\angle \Theta$  is as shown below

Hence side BC is unknown

Now we find BC by applying Pythagoras theorem to right angled  $\triangle ABC$

Therefore,

$$AC^2 = AB^2 + BC^2$$

Now by substituting the value of sides AB and AC from figure (a)

We get,

$$b^2 = a^2 + BC^2$$

Therefore,

$$BC^2 = b^2 - a^2$$

Now by taking square root on both sides

We get,

$$BC = \sqrt{b^2 - a^2}$$

Therefore,

$$\text{Base side BC} = \sqrt{b^2 - a^2} \dots (3)$$

Now we know  $\cos \theta$  is defined as follows

$$\cos \theta = \frac{\text{Base side adjacent to } \angle \theta}{\text{Hypotenuse}} = \frac{\text{Base side adjacent to } \angle \theta}{\text{Hypotenuse}}$$

Therefore from figure (a) and equation (3)

We get,

$$\cos \theta = \frac{BC}{AC} = \frac{BC}{b}$$

$$= \frac{\sqrt{b^2 - a^2}}{b}$$

$$\cos \theta = \frac{BC}{AC} = \frac{BC}{b}$$

$$= \sqrt{b^2-a^2}b \frac{\sqrt{b^2-a^2}}{b} \dots (4)$$

Now we know,  $\sec\Theta = \frac{1}{\cos\Theta}$

Therefore,

$$\sec\Theta = b\sqrt{b^2-a^2} \sec\Theta = \frac{b}{\sqrt{b^2-a^2}} \dots (5)$$

Now we know,  $\tan\Theta = \frac{\sin\Theta}{\cos\Theta}$

Now by substituting the values from equation (1) and (3)

We get,

$$\tan\Theta = \frac{a}{b\sqrt{b^2-a^2}} \tan\Theta = \frac{\frac{a}{b}}{\sqrt{b^2-a^2}} \quad \tan\Theta = a\sqrt{b^2-a^2} \tan\Theta = \frac{a}{\sqrt{b^2-a^2}}$$

Therefore,

$$\tan\Theta = a\sqrt{b^2-a^2} \tan\Theta = \frac{a}{\sqrt{b^2-a^2}} \dots (6)$$

Now we need to find  $\sec\Theta + \tan\Theta$

Now by substituting the values of  $\sec\Theta$  and  $\tan\Theta$  from equation (5) and (6) respectively

We get,

$$\sec\Theta + \tan\Theta = b\sqrt{b^2-a^2} + a\sqrt{b^2-a^2} \frac{b}{\sqrt{b^2-a^2}} + \frac{a}{\sqrt{b^2-a^2}}$$

$$\sec\Theta + \tan\Theta = (b+a)\sqrt{b^2-a^2} \frac{b+a}{\sqrt{b^2-a^2}} \dots (7)$$

We get,

$$\sec\Theta + \tan\Theta = (b+a)\sqrt{b+a}\sqrt{b-a} \frac{b+a}{\sqrt{b+a}\sqrt{b-a}}$$

Now by substituting the value in above expression

We get,

$$\sec\Theta + \tan\Theta = \sqrt{b+a}\sqrt{b-a} \frac{\sqrt{b+a}\sqrt{b-a}}{\sqrt{b+a}\sqrt{b-a}}$$

Now,  $\sqrt{b+a}\sqrt{b-a}$  present in the numerator as well as denominator of above expression gets cancelled we get,

$$\sec\Theta + \tan\Theta = \frac{\sqrt{b+a}}{\sqrt{b-a}}$$

Square root is present in the numerator as well as denominator of above expression

Therefore we can place both numerator and denominator under a common square root sign

$$\text{Therefore, } \sec\Theta + \tan\Theta = \frac{\sqrt{b+a}\sqrt{b-a}}{\sqrt{b-a}} \sec\Theta + \tan\Theta = \frac{\sqrt{b+a}}{\sqrt{b-a}}$$

23.) If  $8\tan A = 15$  , find  $\sin A - \cos A$

Sol.

Given:

$$8\tan A = 15 \quad \tan A = \frac{15}{8}$$

Therefore,

$$\tan A = \frac{15}{8} \quad \dots (1)$$

To find:

$$\sin A - \cos A$$

Now we know  $\tan A$  is defined as follows

$$\tan A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Base side adjacent to } \angle A} \quad \dots (2)$$

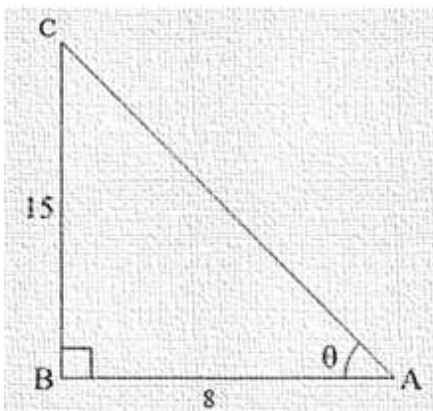

Now by comparing equation (1) and (2)

We get

$$\text{Perpendicular side opposite to } \angle A = 15$$

$$\text{Base side adjacent to } \angle A = 8$$

Therefore triangle representing angle A is as shown below

Side AC = is unknown and can be found by using Pythagoras theorem

Therefore,

$$AC^2 = AB^2 + BC^2$$

Now by substituting the value of known sides from figure (a)

We get,

$$AC^2 = 15^2 + 8^2$$

$$AC^2 = 225 + 64$$

$$AC = 289$$

Now by taking square root on both sides

We get,

$$AC = \sqrt{289} \sqrt{289}$$

$$AC = 17$$

Therefore Hypotenuse side  $AC=17$  .... (3)

Now we know,  $\sin A$  is defined as follows

$$\sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}}$$

Therefore from figure (a) and equation (3)

We get,

$$\sin A = \frac{BC}{AC} \sin A = \frac{15}{17}$$

$$\sin A = \frac{15}{17} \text{ .... (4)}$$

Now we know,  $\cos A$  is defined as follows

$$\cos A = \frac{\text{Base side adjacent to } \angle A}{\text{Hypotenuse}}$$

Therefore from figure (a) and equation (3)

We get,

$$\cos A = \frac{AB}{AC} \cos A = \frac{8}{17}$$

$$\cos A = \frac{8}{17} \text{ .... (5)}$$

Now we find the value of expression  $\sin A - \cos A$

Therefore by substituting the value the value of  $\sin A$  and  $\cos A$  from equation (4) and (5) respectively, we get,

$$\sin A - \cos A = \frac{15}{17} - \frac{8}{17} \sin A - \cos A = \frac{15-8}{17} \sin A - \cos A = \frac{7}{17}$$

$$\sin A - \cos A = \frac{7}{17}$$

Hence,  $\sin A - \cos A = \frac{7}{17}$

24.) If  $\tan \Theta = \frac{20}{21}$ , show that  $\frac{1 - \sin \Theta - \cos \Theta}{1 + \sin \Theta + \cos \Theta} = \frac{3}{7}$

Sol.

Given:

$$\tan \Theta = \frac{20}{21}$$

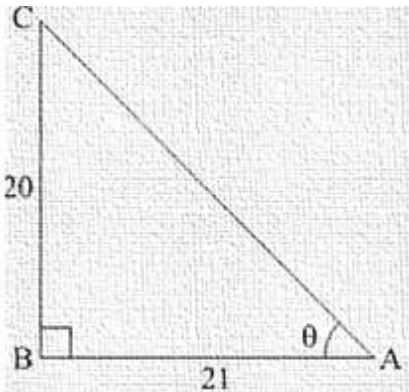

To show that  $\frac{1 - \sin \Theta - \cos \Theta}{1 + \sin \Theta + \cos \Theta} = \frac{3}{7}$

Now we know that

$$\tan \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta} \quad \tan \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Base side adjacent to } \angle \Theta}$$

Therefore,

$$\tan \Theta = \frac{20}{21}$$

Side AC be the hypotenuse and can be found by applying Pythagoras theorem

Therefore,

$$AC^2 = AB^2 + BC^2$$

$$AC^2 = 21^2 + 20^2$$

$$AC^2 = 441 + 400$$

$$AC^2 = 841$$

Now by taking square root on both sides

We get,

$$AC = \sqrt{841} = \sqrt{841}$$

$$AC = 29$$

Therefore Hypotenuse side AC= 29

Now we know,  $\sin \Theta$  is defined as follows,

$$\sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}} \sin \Theta = \frac{\text{Perpendicular side opposite to } \angle \Theta}{\text{Hypotenuse}}$$

Therefore from figure and above equation

We get,

$$\sin \Theta = \frac{AB}{AC} \sin \Theta = \frac{20}{29} \sin \Theta = \frac{20}{29}$$

Now we know  $\cos \Theta$  is defined as follows

$$\cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}} \cos \Theta = \frac{\text{Base side adjacent to } \angle \Theta}{\text{Hypotenuse}}$$

Therefore from figure and above equation

We get,

$$\cos \Theta = \frac{AB}{AC} \cos \Theta = \frac{21}{29} \cos \Theta = \frac{21}{29}$$

Now we need to find the value of expression  $\frac{1-\sin \Theta + \cos \Theta}{1+\sin \Theta + \cos \Theta} = \frac{1-\sin \Theta + \cos \Theta}{1+\sin \Theta + \cos \Theta}$

Therefore by substituting the value of  $\sin \Theta$  and  $\cos \Theta$  from above equations, we get

$$\frac{1-\sin \Theta + \cos \Theta}{1+\sin \Theta + \cos \Theta} = \frac{1-\frac{20}{29} + \frac{21}{29}}{1+\frac{20}{29} + \frac{21}{29}} =$$

$$\frac{29-20+21}{29-20+21} \frac{29}{70} = \frac{30}{70} = \frac{3}{7}$$

Therefore after evaluating we get,

$$\frac{1-\sin \Theta + \cos \Theta}{1+\sin \Theta + \cos \Theta} = 37 \frac{3}{7}$$

Hence,

$$\frac{1-\sin \Theta + \cos \Theta}{1+\sin \Theta + \cos \Theta} =$$

$$37 \frac{3}{7}$$

25.) If  $\text{cosec} A = 2$ , find  $\frac{1}{\tan A} + \frac{\sin A}{1+\cos A}$

Sol.

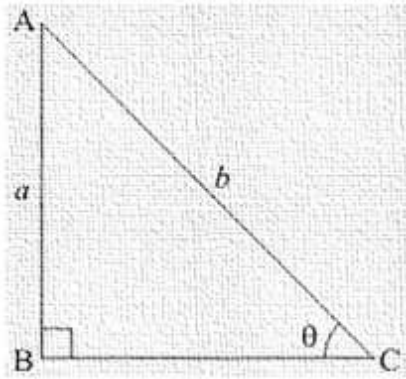

Given:

$$\text{cosec} A = 2$$

To find  $1 + \tan A + \frac{\sin A}{1 + \cos A}$

Now  $\operatorname{cosec} A = \frac{\text{Hypotenuse}}{\text{Opposite side}} = \frac{2}{1}$

Here BC is the adjacent side,

By applying Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$4 = 1 + BC^2$$

$$BC^2 = 3$$

$$BC = \sqrt{3}$$

Now we know that

$$\sin A = \frac{1}{\operatorname{cosec} A} \sin A = \frac{1}{2}$$

$$\sin A = \frac{1}{2} \dots (1)$$

$$\tan A = \frac{AB}{BC} \tan A = \frac{1}{\sqrt{3}}$$

$$\tan A = \frac{1}{\sqrt{3}} \dots (2)$$

$$\cos A = \frac{BC}{AC} \cos A = \frac{\sqrt{3}}{2}$$

$$\cos A = \frac{\sqrt{3}}{2} \dots (3)$$

Substitute all the values of  $\sin A$ ,  $\cos A$  and  $\tan A$  from the equations (1), (2) and (3) respectively

We get.

$$1 + \tan A + \frac{\sin A}{1 + \cos A} = 1 + \frac{1}{\sqrt{3}} + \frac{\frac{1}{2}}{1 + \frac{\sqrt{3}}{2}}$$

$$= \sqrt{3} + 12 + \sqrt{3} \sqrt{3} + \frac{1}{2 + \sqrt{3}}$$

$$= 2(2 + \sqrt{3}) + \sqrt{3} \frac{2(2 + \sqrt{3})}{2 + \sqrt{3}}$$

$$= 2$$

Hence,

$$1 \tan A + \sin A + \cos A \frac{1}{\tan A} + \frac{\sin A}{1 + \cos A} = 2$$

**26.)** If  $\angle A$  and  $\angle B$  are acute angles such that  $\cos A = \cos B$ , then show that  $\angle A = \angle B$

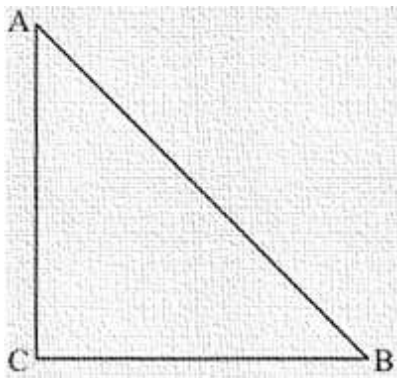

**Sol.**

Given:

$\angle A$  and  $\angle B$  are acute angles

$\cos A = \cos B$  such that  $\angle A = \angle B$

Let us consider right angled triangle ACB

Now since  $\cos A = \cos B$

Therefore

$$\frac{AC}{AB} = \frac{BC}{AB}$$

Now observe that denominator of above equality is same that is AB

Hence  $\frac{AC}{AB} = \frac{BC}{AB}$  only when  $AC = BC$

Therefore  $AC = BC$

We know that when two sides of triangle are equal, then opposite of the sides are also Equal.

Therefore

We can say that

Angle opposite to side AC = angle opposite to side BC

Therefore,

$$\angle B = \angle A$$

$$\text{Hence, } \angle A = \angle B$$

27.) In a  $\triangle ABC$ , right angled triangle at A, if  $\tan C = \sqrt{3}$ , find the value of  $\sin B \cos C + \cos B \sin C$ .

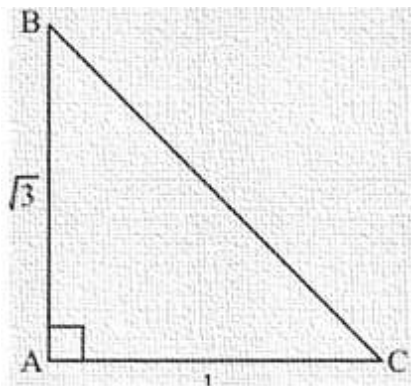

Sol.

Given:

$\triangle ABC$

To find :  $\sin B \cos C + \cos B \sin C$

The given  $\triangle ABC$  is as shown in figure

Side BC is unknown and can be found using Pythagoras theorem,

Therefore,

$$BC^2 = AB^2 + AC^2$$

$$BC^2 = (\sqrt{3})^2 + 1^2$$

$$BC^2 = 3 + 1$$

$$BC^2 = 4$$

Now by taking square root on both sides

We get,

$$BC = \sqrt{4\sqrt{4}}$$

$$BC = 2$$

Therefore Hypotenuse side  $BC = 2 \dots (1)$

$$\text{Now, } \sin B = \frac{\text{Perpendicular side opposite to } \angle B}{\text{Hypotenuse}}$$

Therefore,

$$\sin B = \frac{AC}{BC}$$

Now by substituting the values from equation (1) and figure

We get,

$$\sin B = \frac{1}{2} \dots (2)$$

$$\text{Now, } \cos B = \frac{\text{base side adjacent to } \angle B}{\text{Hypotenuse}}$$

Therefore,

$$\cos B = \frac{AB}{BC}$$

Now substituting the value from equation

$$\cos B = \frac{\sqrt{3}}{2} \dots (3)$$

Similarly

$$\sin C = \frac{\sqrt{3}}{2} \dots (4)$$

Now by definition,

$$\tan C = \frac{\sin C}{\cos C}$$

So by evaluating

$$\cos C = \frac{1}{2} \dots (5)$$

Now, by substituting the value of  $\sin B$ ,  $\cos B$ ,  $\sin C$  and  $\cos C$  from equation (2), (3), (4) and (5) respectively in  $\sin B \cos C + \cos B \sin C$

$$\sin B \cos C + \cos B \sin C = \frac{1}{2} \times \frac{1}{2} + \frac{\sqrt{3}}{2} \times \frac{\sqrt{3}}{2}$$

$$= \frac{1}{4} + \frac{3}{4}$$

$$= 1$$

Hence,

$$\sin B \cos C + \cos B \sin C = 1$$

28.) State whether the following are true or false. Justify your answer.

(i) The value of  $\tan A$  is always less than 1.

(ii)  $\sec A = 125 \frac{12}{5}$  for some value of  $\angle A$ .

(iii)  $\cos A$  is the abbreviation used for the cosecant of  $\angle A$ .

(iv)  $\sin \Theta = 43 \sin \Theta = \frac{4}{3}$  for some angle  $\Theta$ .

**Sol.**

(i)  $\tan A < 1$

Value of  $\tan A$  at  $45^\circ$  i.e...  $\tan 45 = 1$

As value of  $A$  increases to  $90^\circ$

$\tan A$  becomes infinite

So given statement is false.

(ii)  $\sec A = 125 \frac{12}{5}$  for some value of angle if

M-I

$$\sec A = 2.4$$

$$\sec A > 1$$

So given statements is true.

M- II

For  $\sec A = 125 \frac{12}{5}$  we get adjacent side = 13

Subtending 9i at B.

So, given statement is true.

(iii)  $\cos A$  is the abbreviation used for cosecant of angle  $A$ .

The given statement is false.

As such  $\cos A$  is the abbreviation used for cos of angle  $A$ , not as cosecant of angle  $A$ .

(iv)  $\cot A$  is the product of  $\cot A$  and  $A$

Given statement is false

$\therefore \cot A$  is a co-tangent of angle A and co-tangent of angle A =  $\frac{\text{adjacent side}}{\text{opposite side}}$

(v)  $\sin \theta = \frac{4}{3}$  for some angle  $\theta$ .

Given statement is false

Since value of  $\sin \theta$  is less than (or) equal to one.

Here value of  $\sin \theta$  exceeds one,

So given statement is false.

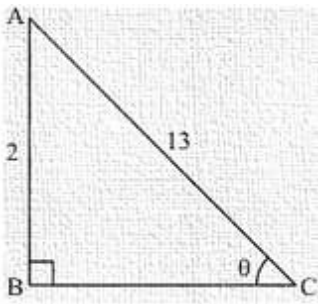

29.) If  $\sin \theta = \frac{12}{13}$  find  $\frac{\sin^2 \theta - \cos^2 \theta}{2 \sin \theta \cos \theta} \times \frac{1}{\tan^2 \theta}$

Sol.

Given:  $\sin \theta = \frac{12}{13}$

To Find:  $\frac{\sin^2 \theta - \cos^2 \theta}{2 \sin \theta \cos \theta} \times \frac{1}{\tan^2 \theta}$

As shown in figure

Here BC is the adjacent side,

By applying Pythagoras theorem,

$$AC^2 = AB^2 + BC^2$$

$$169 = 144 + BC^2$$

$$BC^2 = 169 - 144$$

$$BC^2 = 25$$

$$BC = 5$$

Now we know that,

$$\cos \theta = \frac{\text{base side adjacent to } \angle \theta}{\text{Hypotenuse}} \quad \cos \theta = \frac{BC}{AC}$$

$$\cos \theta = \frac{5}{13}$$

We also know that,

$$\tan \Theta = \frac{\sin \Theta}{\cos \Theta} \Rightarrow \sin \Theta = \cos \Theta \tan \Theta = \frac{\sin \Theta}{\cos \Theta}$$

Therefore, substituting the value of  $\sin \Theta$  and  $\cos \Theta$  from above equations

We get,

$$\tan \Theta = 125 \tan \Theta = \frac{12}{5}$$

Now substitute all the values of  $\sin \Theta$ ,  $\cos \Theta$  and  $\tan \Theta$  from above equations

$$\text{in } \frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta}$$

We get,

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta} = \frac{\left(\frac{12}{13}\right)^2 - \left(\frac{5}{13}\right)^2}{2 \times \left(\frac{12}{13}\right) \times \left(\frac{5}{13}\right)} \times \frac{1}{\left(\frac{12}{5}\right)^2}$$

Therefore by further simplifying we get,

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta} = 119169 \times 169120 \times 25144 \frac{119}{169} \times \frac{169}{120} \times \frac{25}{144}$$

Therefore,

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta} = 5953456 \frac{595}{3456}$$

Hence,

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta} = 5953456 \frac{595}{3456}$$

**30.) If  $\cos \Theta = \frac{5}{13}$ , find the value of  $\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta}$**

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta}$$

**Sol.**

$$\text{Given: If } \cos \Theta = \frac{5}{13}$$

To find:

$$\text{The value of expression } \frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta}$$

Now we know that

$$\cos \Theta = \frac{\text{base side adjacent to } \angle \Theta}{\text{Hypotenuse}} \dots (2)$$

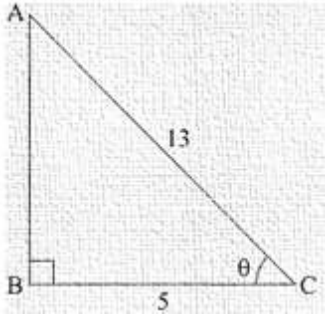

Now when we compare equation (1) and (2)

We get,

Base side adjacent to  $\angle \Theta$  = 5

Hypotenuse = 13

Therefore, Triangle representing  $\angle \Theta$  is as shown below

Perpendicular side AB is unknown and it can be found by using Pythagoras theorem

Therefore by applying Pythagoras theorem

We get,

$$AC^2 = AB^2 + BC^2$$

Therefore by substituting the values of known sides,

$$13^2 = AB^2 + 5^2$$

$$169 = AB^2 + 25$$

$$AB^2 = 144$$

$$AB = 12 \dots (3)$$

Now we know from figure and equation,

$$\sin \Theta = \frac{12}{13} \dots (4)$$

Now we know that,

$$\tan \Theta = \frac{\sin \Theta}{\cos \Theta}$$

$$\tan \Theta = \frac{12}{5} \dots (5)$$

Now we substitute all the values from equation (1), (4) and (5) in the expression below,

$$\frac{\sin^2 \Theta - \cos^2 \Theta}{2 \sin \Theta \cos \Theta} \times \frac{1}{\tan^2 \Theta}$$

Therefore

We get,

$$\sin^2\theta - \cos^2\theta \times 2\sin\theta\cos\theta \times 1\tan^2\theta \frac{\sin^2\theta - \cos^2\theta}{2\sin\theta\cos\theta} \times \frac{1}{\tan^2\theta} = \left(\frac{12}{13}\right)^2 - \left(\frac{5}{13}\right)^2 \times 2 \times \left(\frac{12}{13}\right) \times \left(\frac{5}{13}\right) \times 1 \times \left(\frac{12}{5}\right)^2$$

$$\frac{\left(\frac{12}{13}\right)^2 - \left(\frac{5}{13}\right)^2}{2 \times \left(\frac{12}{13}\right) \times \left(\frac{5}{13}\right)} \times \frac{1}{\left(\frac{12}{5}\right)^2}$$

Therefore by further simplifying we get,

$$\sin^2\theta - \cos^2\theta \times 2\sin\theta\cos\theta \times 1\tan^2\theta \frac{\sin^2\theta - \cos^2\theta}{2\sin\theta\cos\theta} \times \frac{1}{\tan^2\theta} = 119169 \times 169120 \times 25144 \frac{119}{169} \times \frac{169}{120} \times \frac{25}{144}$$

Therefore,

$$\sin^2\theta - \cos^2\theta \times 2\sin\theta\cos\theta \times 1\tan^2\theta \frac{\sin^2\theta - \cos^2\theta}{2\sin\theta\cos\theta} \times \frac{1}{\tan^2\theta} = 5953456 \frac{595}{3456}$$

Hence,

$$\sin^2\theta - \cos^2\theta \times 2\sin\theta\cos\theta \times 1\tan^2\theta \frac{\sin^2\theta - \cos^2\theta}{2\sin\theta\cos\theta} \times \frac{1}{\tan^2\theta} = 5953456 \frac{595}{3456}$$

**31.) If  $\sec A = 178 \frac{17}{8}$ , verify that  $3 - 4\sin^2 A \cos^2 A - 3 = 3 - \tan^2 A - 3\tan^2 A \frac{3 - 4\sin^2 A}{4\cos^2 A - 3} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A}$**

**Sol.**

Given:  $\sec A = 178 \frac{17}{8}$

To verify:  $3 - 4\sin^2 A \cos^2 A - 3 = 3 - \tan^2 A - 3\tan^2 A \frac{3 - 4\sin^2 A}{4\cos^2 A - 3} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A}$

Now we know that  $\cos A = \frac{1}{\sec A} \cos A = \frac{1}{\sec A}$

Now, by substituting the value of  $\sec A$

We get,

$$\cos A = \frac{1}{178 \frac{17}{8}} \cos A = \frac{8}{17}$$

Now we also know that,

$$\sin^2 A + \cos^2 A = 1 \sin^2 A + \cos^2 A = 1$$

Therefore

$$\sin^2 A = 1 - \cos^2 A \sin^2 A = 1 - \cos^2 A$$

$$= \left(178 \frac{17}{8}\right)^2 \left(\frac{8}{17}\right)^2$$

$$= 225289 \frac{225}{289}$$

Now by taking square root on both sides,

We get,

$$\sin A = \frac{15}{17}$$

We also know that,  $\tan A = \frac{\sin A}{\cos A}$

Now by substituting the value of all the terms,

We get,

$$\tan A = \frac{15}{8}$$

Now from the expression of above equation which we want to prove:

$$\text{L.H.S} = \frac{3-4\sin^2 A}{4\cos^2 A-3} = \frac{3-4\sin^2 A}{4\cos^2 A-3}$$

Now by substituting the value of cos A and sin A from equation (3) and (4)

We get,

$$\text{L.H.S} = \frac{3-4\left(\frac{225}{289}\right)}{4\left(\frac{64}{289}\right)-3}$$

$$= \frac{867-900}{256-867} = \frac{867-900}{256-867}$$

$$= 33611 \frac{33}{611}$$

From expression

$$\text{R.H.S} = \frac{3-\tan^2 A}{1-3\tan^2 A} = \frac{3-\tan^2 A}{1-3\tan^2 A}$$

Now by substituting the value of tan A from above equation

We get,

$$\text{R.H.S} = \frac{3-\left(\frac{15}{8}\right)^2}{1-3\left(\frac{15}{8}\right)^2}$$

$$= \frac{-3364 - 61164 \frac{-33}{64}}{\frac{-611}{64}}$$

$$= 33611 \frac{33}{611}$$

Therefore,

We can see that,

$$3-4\sin^2 A \over 4\cos^2 A-3 = 3-\tan^2 A \over 1-3\tan^2 A = \frac{3-4\sin^2 A}{4\cos^2 A-3} = \frac{3-\tan^2 A}{1-3\tan^2 A}$$

32.) If  $\sin\Theta = \frac{3}{4}$ , prove that  $\sqrt{\text{cosec}^2\Theta - \cot^2\Theta} = \frac{\sqrt{7}}{3}$

Sol.

Given:  $\sin\Theta = \frac{3}{4}$  .... (1)

To prove:

$\sqrt{\text{cosec}^2\Theta - \cot^2\Theta} = \frac{\sqrt{7}}{3}$  .... (2)

By definition,

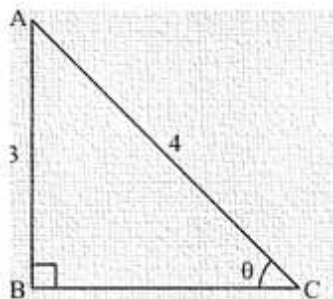

$\sin A = \frac{\text{Perpendicular side opposite to } \angle A}{\text{Hypotenuse}}$  .... (3)

By comparing (1) and (3)

We get,

Perpendicular side = 3 and

Hypotenuse = 4

Side BC is unknown.

So we find BC by applying Pythagoras theorem to right angled  $\Delta ABC$

Hence,

$AC^2 = AB^2 + BC^2$

Now we substitute the value of perpendicular side (AB) and hypotenuse (AC) and get the base side (BC)

Therefore,

$4^2 = 3^2 + BC^2$

$BC^2 = 16 - 9$

$BC^2 = 7$

$$BC = \sqrt{7}\sqrt{7}$$

$$\text{Hence, Base side } BC = \sqrt{7}\sqrt{7} \dots (3)$$

$$\text{Now } \cos A = \frac{BC}{AC}$$

$$\sqrt{7}4 \frac{\sqrt{7}}{4} \dots (4)$$

$$\text{Now, } \operatorname{cosec} A = \frac{1}{\sin A}$$

Therefore, from fig and equation (1)

$$\operatorname{cosec} A = \frac{\text{Hypotenuse}}{\text{Perpendicular}}$$

$$\operatorname{cosec} A = \frac{43}{3} \operatorname{cosec} A = \frac{4}{3} \dots (5)$$

Now, similarly

$$\sec A = \frac{4\sqrt{7}}{\sqrt{7}} \sec A = \frac{4}{\sqrt{7}} \dots (6)$$

Further we also know that

$$\cot A = \frac{\cos A}{\sin A}$$

Therefore by substituting the values from equation (1) and (4),

We get,

$$\cot A = \sqrt{7}3 \cot A = \frac{\sqrt{7}}{3} \dots (7)$$

Now by substituting the value of cosec A, sec A and cot A from the equations (5), (6), and (7) in the L.H.S of expression (2)

$$\sqrt{\operatorname{cosec}^2 \theta - \cot^2 \theta} \sec^2 \theta - 1 = \sqrt{\frac{\operatorname{cosec}^2 \theta - \cot^2 \theta}{\sec^2 \theta - 1}} = \sqrt{\frac{(4/3)^2 - (\frac{\sqrt{7}}{3})^2}{(\frac{4}{\sqrt{7}})^2 - 1}}$$

$$= \sqrt{\frac{16/9 - 7/9}{16/7 - 1}}$$

$$= \sqrt{7}3 \frac{\sqrt{7}}{3}$$

Hence it is proved that,

$$\sqrt{\operatorname{cosec}^2 \theta - \cot^2 \theta} \sec^2 \theta - 1 = \sqrt{7}3 \sqrt{\frac{\operatorname{cosec}^2 \theta - \cot^2 \theta}{\sec^2 \theta - 1}} = \frac{\sqrt{7}}{3}$$

33.) If  $\sec A = 17$ , verify that  $3 - 4\sin^2 A = 4\cos^2 A - 3 = 3 - \tan^2 A = 1 - 3\tan^2 A$   $\frac{3 - 4\sin^2 A}{4\cos^2 A - 3} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A}$

Sol.

$$\text{Given: } \sec A = 17 \implies \sec A = \frac{17}{1} \dots (1)$$

To verify:

$$3 - 4\sin^2 A = 4\cos^2 A - 3 = 3 - \tan^2 A = 1 - 3\tan^2 A \implies \frac{3 - 4\sin^2 A}{4\cos^2 A - 3} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A} \dots (2)$$

$$\text{Now we know that } \sec A = \frac{1}{\cos A} \implies \cos A = \frac{1}{\sec A}$$

$$\text{Therefore } \cos A = \frac{1}{\sec A} = \frac{1}{17}$$

We get,

$$\cos A = \frac{1}{17} \dots (3)$$

Similarly we can also get,

$$\sin A = \frac{\sqrt{1 - \cos^2 A}}{\cos A} = \frac{\sqrt{1 - \left(\frac{1}{17}\right)^2}}{\frac{1}{17}} \dots (4)$$

$$\text{An also we know that } \tan A = \frac{\sin A}{\cos A} \implies \tan A = \frac{\sin A}{\frac{1}{17}}$$

$$\tan A = 15 \dots (5)$$

Now from the expression of equation (2)

L.H.S: Missing close brace

Now by substituting the value of  $\cos A$  and  $\sin A$  from equation (3) and (4)

We get,

$$\text{L.H.S} = \frac{3 - 4\left(\frac{1}{17}\right)^2}{4\left(\frac{1}{17}\right)^2 - 3}$$

$$= \frac{867 - 900}{289} = \frac{256 - 867}{289}$$

$$= 33611 \frac{33}{611} \dots (6)$$

$$\text{R.H.S} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A}$$

Now by substituting the value of  $\tan A$  from equation (5)

We get,

$$\text{R.H.S} = 3 - \left(\frac{15}{18}\right)^2 \cdot 1 - 3 \left(\frac{15}{18}\right)^2 \frac{3 - \left(\frac{15}{18}\right)^2}{1 - 3\left(\frac{15}{18}\right)^2}$$

$$-3364 - 61164 \frac{\frac{-33}{64}}{\frac{-611}{64}}$$

$$= 33611 \frac{33}{611} \dots (7)$$

Now by comparing equation (6) and (7)

We get,

$$3 - 4\sin^2 A \cdot 4\cos^2 A - 3 = 3 - \tan^2 A \cdot 1 - 3\tan^2 A \frac{3 - 4\sin^2 A}{4\cos^2 A - 3} = \frac{3 - \tan^2 A}{1 - 3\tan^2 A}$$

**34.) If  $\cot \Theta = 34$   $\cot \Theta = \frac{3}{4}$ , prove that  $\sec \Theta - \operatorname{cosec} \Theta \sec \Theta + \operatorname{cosec} \Theta = 1\sqrt{7} \frac{\sec \Theta - \operatorname{cosec} \Theta}{\sec \Theta + \operatorname{cosec} \Theta} = \frac{1}{\sqrt{7}}$**

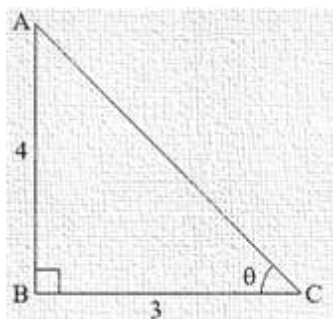

**Sol.**

Given:  $\cot \Theta = 34$   $\cot \Theta = \frac{3}{4}$

Prove that:  $\sec \Theta - \operatorname{cosec} \Theta \sec \Theta + \operatorname{cosec} \Theta = 1\sqrt{7} \frac{\sec \Theta - \operatorname{cosec} \Theta}{\sec \Theta + \operatorname{cosec} \Theta} = \frac{1}{\sqrt{7}}$

Now we know that

$$\sec \Theta - \operatorname{cosec} \Theta \sec \Theta + \operatorname{cosec} \Theta = 1\sqrt{7} \frac{\sec \Theta - \operatorname{cosec} \Theta}{\sec \Theta + \operatorname{cosec} \Theta} = \frac{1}{\sqrt{7}}$$

Here AC is the hypotenuse and we can find that by applying Pythagoras theorem

$$AC^2 = AB^2 + BC^2$$

$$AC^2 = 16 + 9$$

$$AC^2 = 25$$

$$AC = 5$$

Similarly

$$\sec\Theta = \frac{AC}{BC} \sec\Theta = \frac{AC}{BC} \sec\Theta = 53 \sec\Theta = \frac{5}{3} \quad \text{cosec} = \frac{AC}{AB} \text{cosec} = \frac{AC}{AB} \text{cosec} = 54 \text{cosec} = \frac{5}{4}$$

Now on substituting the values in equations we get,

$$\sec\Theta - \text{cosec}\Theta \sec\Theta + \text{cosec}\Theta = 1\sqrt{7} \frac{\sec\Theta - \text{cosec}\Theta}{\sec\Theta + \text{cosec}\Theta} = \frac{1}{\sqrt{7}}$$

Therefore,

$$\sec\Theta - \text{cosec}\Theta \sec\Theta + \text{cosec}\Theta = 1\sqrt{7} \frac{\sec\Theta - \text{cosec}\Theta}{\sec\Theta + \text{cosec}\Theta} = \frac{1}{\sqrt{7}}$$

**35.) If  $3\cos\Theta - 4\sin\Theta = 2\cos\Theta + \sin\Theta$  ,find  $\tan\Theta$**

**Sol.**

$$\text{Given: } 3\cos\Theta - 4\sin\Theta = 2\cos\Theta + \sin\Theta$$

To find:  $\tan\Theta$

We can write this as:

$$3\cos\Theta - 4\sin\Theta = 2\cos\Theta + \sin\Theta \quad \cos\Theta = 5\sin\Theta \quad \cos\Theta = 5\sin\Theta$$

Dividing both the sides by  $\cos\Theta$  ,

We get,

$$\cos\Theta \cos\Theta = 5\sin\Theta \cos\Theta \quad \frac{\cos\Theta}{\cos\Theta} = \frac{5\sin\Theta}{\cos\Theta} \quad 1 = 5\tan\Theta \quad 1 = 5\tan\Theta \quad \tan\Theta = \frac{1}{5} \tan\Theta = \frac{1}{5}$$

Hence,

$$\tan\Theta = \frac{1}{5} \tan\Theta = \frac{1}{5}$$

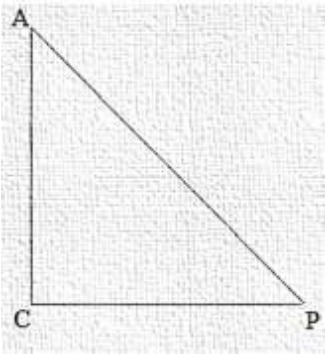

**36.) If  $\angle A$  and  $\angle P$  are acute angles such that  $\tan A = \tan P$ , then show  $\angle A = \angle P$**

**Sol.**

Given: A and P are acute angles  $\tan A = \tan P$

Prove that:  $\angle A = \angle P$

Let us consider right angled triangle ACP

We know  $\tan \Theta = \frac{\text{opposite side}}{\text{adjacent side}}$

$$\tan A = \frac{PC}{AC}$$

$$\tan P = \frac{AC}{PC}$$

$$\therefore \tan A = \tan P$$

$$PC/AC = AC/PC \Rightarrow \frac{PC}{AC} = \frac{AC}{PC}$$

$PC = AC$  [ $\because$  Angle opposite to equal sides are equal]

$$\angle A = \angle P$$
