

## RD Sharma Class 9 Solutions Chapter 12 Heron's Formula Ex 12.6

Question 1.

In  $\triangle ABC$ , if  $\angle A = 40^\circ$  and  $\angle B = 60^\circ$ . Determine the longest and shortest sides of the triangle.

Solution:

In  $\triangle ABC$ ,  $\angle A = 40^\circ$ ,  $\angle B = 60^\circ$

But  $\angle A + \angle B + \angle C = 180^\circ$

$$\Rightarrow 40^\circ + 60^\circ + \angle C = 180^\circ$$

$$\Rightarrow \angle C = 180^\circ - (40^\circ + 60^\circ)$$

$$= 180^\circ - 100^\circ = 80^\circ$$

$\therefore \angle C = 80^\circ$ , which is the greatest angle and  $\angle A = 40^\circ$  is the smallest angle

$\therefore$  Side AB which is opposite to the greatest angle is the longest and side BC which is opposite to the smallest angle is the shortest.

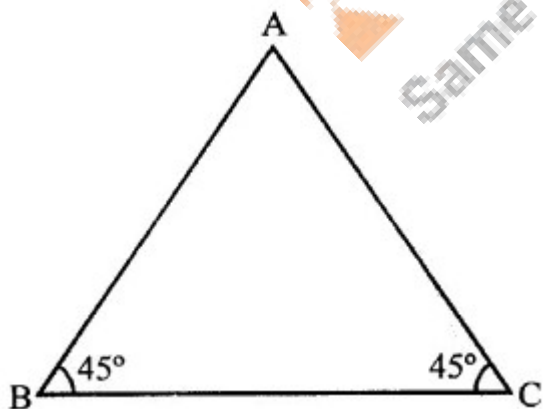

Question 2.

In a  $\triangle ABC$ , if  $\angle B = \angle C = 45^\circ$ . which is the longest side?

Solution:

In  $\triangle ABC$ ,  $\angle B = \angle C = 45^\circ$

But  $\angle A + \angle B + \angle C = 180^\circ$

$$\Rightarrow \angle A + 45^\circ + 45^\circ = 180^\circ$$

$$\Rightarrow \angle A + 90^\circ = 180^\circ$$

$$\therefore \angle A = 180^\circ - 90^\circ = 90^\circ$$

$\therefore \angle A$  is the greatest

$\therefore$  Side BC opposite to it is the longest

Question 3.

In  $\triangle ABC$ , side AB is produced to D so that  $BD = BC$ . If  $\angle B = 60^\circ$  and  $\angle A = 70^\circ$ , prove that :

(i)  $AD > CD$

(ii)  $AD > AC$

Solution:

Given : In  $\triangle ABC$ , side BC is produced to D such that  $BD = BC$   
 $\angle A = 70^\circ$  and  $\angle B = 60^\circ$

To prove :

(i)  $AD > CD$  (ii)  $AD > AC$

Proof: In  $\triangle ABC$ ,

$\angle A = 70^\circ$ ,  $\angle B = 60^\circ$

But Ext.  $\angle CBD + \angle CBA = 180^\circ$  (Linear pair)

$\angle CBD + 60^\circ = 180^\circ$

$\Rightarrow \angle CBD = 180^\circ - 60^\circ = 120^\circ$

But in  $\triangle BCD$ ,

$BD = BC$

$\therefore \angle D = \angle BCD$

But  $\angle D + \angle BCD = 180^\circ - 120^\circ = 60^\circ$

$\therefore \angle D = \angle BCD = 60^\circ \div 2 = 30^\circ$

and in  $\triangle ABC$ ,

$\angle A + \angle B + \angle C = 180^\circ$

$\Rightarrow 70^\circ + 60^\circ + \angle C = 180^\circ$

$\Rightarrow 130^\circ + \angle C = 180^\circ$

$\therefore \angle C = 180^\circ - 130^\circ = 50^\circ$

Now  $\angle ACD = \angle ACB + \angle BCD = 50^\circ + 30^\circ = 80^\circ$

(i) Now in  $\triangle ACD$ ,

$\angle ACD = 80^\circ$  and  $\angle A = 70^\circ$

$\therefore$  Side  $AD > CD$

(Greater angle has greatest side opposite to it)

(ii)  $\because \angle ACD = 80^\circ$  and  $\angle D = 30^\circ$

$\therefore AD > AC$

Question 4.

Is it possible to draw a triangle with sides of length 2 cm, 3 cm and 7 cm?

Solution:

We know that in a triangle, sum of any two sides is greater than the third side and 2

cm + 3 cm = 5 cm and 5 cm < 7 cm  
 $\therefore$  This triangle is not possible to draw

Question 5.

In  $\triangle ABC$ ,  $\angle B = 35^\circ$ ,  $\angle C = 65^\circ$  and the bisector of  $\angle BAC$  meets BC in P. Arrange AP, BP and CP in descending order.

Solution:

In  $\triangle ABC$ ,  $\angle B = 35^\circ$ ,  $\angle C = 65^\circ$  and AP is the bisector of  $\angle BAC$  which meets BC in P.  
 Arrange PA, PB and PC in descending order In  $\triangle ABC$ ,  
 $\angle A + \angle B + \angle C = 180^\circ$  (Sum of angles of a triangle)

$$\Rightarrow \angle A + 35^\circ + 65^\circ = 180^\circ$$

$$\angle A + 100^\circ = 180^\circ$$

$$\therefore \angle A = 180^\circ - 100^\circ = 80^\circ$$

$\therefore$  PA is a bisector of  $\angle BAC$

$$\therefore \angle 1 = \angle 2 = 80^\circ \div 2 = 40^\circ$$

Now in  $\triangle ACP$ ,  $\angle ACP > \angle CAP$

$$\Rightarrow \angle C > \angle 2$$

$$\therefore AP > CP \dots (i)$$

Similarly, in  $\triangle ABP$ ,

$$\angle BAP > \angle ABP \Rightarrow \angle 1 > \angle B$$

$$\therefore BP > AP \dots (ii)$$

From (i) and (ii)

$$BP > AP > CP$$

Question 6.

Prove that the perimeter of a triangle is greater than the sum of its altitudes

Solution:

Given : In  $\triangle ABC$ ,

AD, BE and CF are altitudes

To prove :  $AB + BC + CA > AD + BC + CF$

Proof : We know that side opposite to greater angle is greater.

In  $\triangle ABD$ ,  $\angle D = 90^\circ$

$\therefore \angle D > \angle B$

$\therefore AB > AD \dots(i)$

Similarly, we can prove that

$BC > BE$  and

$CA > CF$

Adding we get,

$AB + BC + CA > AD + BE + CF$

Question 7.

In the figure, prove that:

(i)  $CD + DA + AB + BC > 2AC$

(ii)  $CD + DA + AB > BC$

Solution:

Given : In the figure, ABCD is a quadrilateral and AC is joined

To prove :

(i)  $CD + DA + AB + BC > 2AC$

(ii)  $CD + DA + AB > BC$

Proof:

(i) In  $\triangle ABC$ ,

$AB + BC > AC \dots(i)$

(Sum of two sides of a triangle is greater than its third side)

Similarly in  $\triangle ADC$ ,

$$CD + DA > AC \dots(ii)$$

Adding (i) and (ii)

$$CD + DA + AB + BC > AC + AC$$

$$\Rightarrow CD + DA + AB + BC > 2AC$$

(ii) In  $\triangle ACD$ ,

$$CD + DA > CA$$

(Sum of two sides of a triangle is greater than its third side)

Adding AB to both sides,

$$CD + DA + AB > CA + AB$$

But  $CA + AB > BC$  (in  $\triangle ABC$ )

$$\therefore CD + DA + AD > BC$$

Question 8.

Which of the following statements are true (T) and which are false (F)?

(i) Sum of the three sides of a triangle is less than the sum of its three altitudes.

(ii) Sum of any two sides of a triangle is greater than twice the median drawn to the third side.

(iii) Sum of any two sides of a triangle is greater than the third side.

(iv) Difference of any two sides of a triangle is equal to the third side.

(v) If two angles of a triangle are unequal, then the greater angle has the larger side opposite to it.

(vi) Of all the line segments that can be drawn from a point to a line not containing it, the perpendicular line segment is the shortest one.

Solution:

(i) False. Sum of three sides of a triangle is greater than the sum of its altitudes.

(ii) True.

(iii) True.

(iv) False. Difference of any two sides is less than the third side.

(v) True.

(vi) True.

Question 9.

Fill in the blanks to make the following statements true.

(i) In a right triangle, the hypotenuse is the ..... side.

(ii) The sum of three altitudes of a triangle is ..... than its perimeter.

(iii) The sum of any two sides of a triangle is ..... than the third side.

(iv) If two angles of a triangle are unequal, then the smaller angle has the ..... side opposite to it.

(v) Difference of any two sides of a triangle is..... than the third side.

(vi) If two sides of a triangle are unequal, then the larger side has ..... angle opposite to it.

Solution:

(i) In a right triangle, the hypotenuse is the longest side.

(ii) The sum of three altitudes of a triangle is less than its perimeter.

(iii) The sum of any two sides of a triangle is greater than the third side.

(iv) If two angles of a triangle are unequal, then the smaller angle has the smaller

side opposite to it.

(v) Difference of any two sides of a triangle is less than the third side.

(vi) If two sides of a triangle are unequal, then the larger side has greater angle opposite to it.

Question 10.

O is any point in the interior of  $\triangle ABC$ . Prove that

(i)  $AB + AC > OB + OC$

(ii)  $AB + BC + CA > OA + OB + OC$

(iii)  $OA + OB + OC > \frac{1}{2}(AB + BC + CA)$

Solution:

Given : In  $\triangle ABC$ , O is any point in the interior of the  $\triangle ABC$ , OA, OB and OC are joined

To prove :

(i)  $AB + AC > OB + OC$

(ii)  $AB + BC + CA > OA + OB + OC$

(iii)  $OA + OB + OC > \frac{1}{2}(AB + BC + CA)$

Construction : Produce BO to meet AC in D.

Proof: In  $\triangle ABD$ ,

(i)  $AB + AD > BD$  (Sum of any two sides of a triangle is greater than third)

$\Rightarrow AB + AD > BO + OD$  ... (i)

Similarly, in  $\triangle ODC$ ,

$OD + DC > OC$  ... (ii)

Adding (i) and (ii)

$AB + AD + OD + DC > OB + OD + OC$

$\Rightarrow AB + AD + DC > OB + OC$

$\Rightarrow AB + AC > OB + OC$

(ii) Similarly, we can prove that

$BC + AB > OA + OC$

and  $CA + BC > OA + OB$

(iii) In  $\triangle OAB$ ,  $\triangle OBC$  and  $\triangle OCA$ ,

$OA + OB > AB$

$OB + OC > BC$

and  $OC + OA > CA$

Adding, we get

$2(OA + OB + OC) > AB + BC + CA$

$\therefore OA + OB + OC > \frac{1}{2}(AB + BC + CA)$

Question 11.

Prove that in a quadrilateral the sum of all the sides is greater than the sum of its

diagonals.

Solution:

Given : In quadrilateral ABCD, AC and BD are its diagonals,

To prove :  $AB + BC + CD + DA > AC + BD$

Proof: In  $\triangle ABC$ ,

$AB + BC > AC$  ... (i)

(Sum of any two sides of a triangle is greater than its third side)

Similarly, in  $\triangle ADC$ ,

$DA + CD > AC$  ... (ii)

In  $\triangle ABD$ ,

$AB + DA > BD$  ... (iii)

In  $\triangle BCD$ ,

$BC + CD > BD$  ... (iv)

Adding (i), (ii), (iii) and (iv)

$2(AB + BC + CD + DA) > 2AC + 2BD$

$\Rightarrow 2(AB + BC + CD + DA) > 2(AC + BD)$

$\therefore AB + BC + CD + DA > AC + BD$
