

## NCERT Solutions Class 11 Maths Chapter 10 Exercise 10.3

### Question 1:

Reduce the following equation into slope-intercept form and find their slopes and the y-intercepts.

(i)  $x + 7y = 0$                       (ii)  $6x + 3y - 5 = 0$                       (iii)  $y = 0$

### Solution:

- (i) The given equation is  $x + 7y = 0$   
It can be written as

$$y = -\frac{1}{7}x + 0$$

This equation is of the form  $y = mx + c$ , where  $m = -\frac{1}{7}$  and  $c = 0$

Therefore, equation  $x + 7y = 0$  is the slope-intercept form, where the slope and the y-intercept are  $-\frac{1}{7}$  and 0 respectively.

- (ii) The given equation is  $6x + 3y - 5 = 0$   
It can be written as

$$y = \frac{1}{3}(-6x + 5)$$

$$y = -2x + \frac{5}{3}$$

This equation is of the form  $y = mx + c$ , where  $m = -2$  and  $c = \frac{5}{3}$

Therefore, equation  $6x + 3y - 5 = 0$  is the slope-intercept form, where the slope and the y-intercept are  $-2$  and  $\frac{5}{3}$  respectively.

- (iii) The given equation is  $y = 0$ .  
It can be written as  $y = 0 \cdot x + 0$

This equation is of the form  $y = mx + c$ , where  $m = 0$  and  $c = 0$ .

Therefore, equation  $y = 0$  is in the slope-intercept form, where the slope and the y-intercept are 0 and 0 respectively.

### Question 2:

Reduce the following equations into intercept form and find their intercepts on the axis.

(i)  $3x + 2y - 12 = 0$                       (ii)  $4x - 3y = 6$                       (iii)  $3y + 2 = 0$

**Solution:**

(i) The given equation is  $3x + 2y - 12 = 0$

It can be written as

$$3x + 2y = 12$$

$$\frac{3x}{12} + \frac{2y}{12} = 1$$

$$\frac{x}{4} + \frac{y}{6} = 1 \quad \dots(1)$$

This equation is of the form  $\frac{x}{a} + \frac{y}{b} = 1$ , where  $a = 4$  and  $b = 6$ .

Therefore, equation (1) is in the intercept form, where the intercepts on the  $x$  and  $y$  axes are 4 and 6 respectively.

(ii) The given equation is  $4x - 3y = 6$ .

It can be written as

$$\frac{4x}{6} - \frac{3y}{6} = 1$$

$$\frac{2x}{3} - \frac{y}{2} = 1$$

$$\frac{x}{\frac{3}{2}} + \frac{y}{(-2)} = 1 \quad \dots(2)$$

This equation is of the form  $\frac{x}{a} + \frac{y}{b} = 1$ , where  $a = \frac{3}{2}$  and  $b = -2$ .

Therefore, equation (2) is in the intercept form, where the intercepts on  $x$  and  $y$ -axes are  $\frac{3}{2}$  and  $-2$  respectively.

(iii) The given equation is  $3y + 2 = 0$

It can be written as

$$3y = -2$$

$$\frac{y}{\left(-\frac{2}{3}\right)} = 1 \quad \dots(3)$$

This equation is of the form  $\frac{x}{a} + \frac{y}{b} = 1$ , where  $a = 0$  and  $b = -\frac{2}{3}$ .

Therefore, equation (3) is in the intercept form, where the intercepts on the  $y$ -axis is  $-\frac{2}{3}$  and it has no intercept on the  $x$ -axis.

### Question 3:

Reduce the following equations into normal form. Find their perpendicular distance from the origin and angle between perpendicular and the positive x-axis.

(i)  $x - 3\sqrt{y} + 8 = 0$

(ii)  $y - 2 = 0$

(iii)  $x - y = 4$

### Solution:

- (i) The given equation is  $x - 3\sqrt{y} + 8 = 0$   
It can be written as

$$x - 3\sqrt{y} = -8$$

$$-x + 3\sqrt{y} = 8$$

On dividing both sides by  $\sqrt{(-1)^2 + (\sqrt{3})^2} = \sqrt{4} = 2$ , we obtain

$$-\frac{x}{2} + \frac{\sqrt{3}}{2}y = \frac{8}{2}$$

$$\left(-\frac{1}{2}\right)x + \left(\frac{\sqrt{3}}{2}\right)y = 4$$

$$x \cos 120^\circ + y \sin 120^\circ = 4 \quad \dots(1)$$

Equation (1) is in the normal form.

On comparing equation (1) with the normal form of equation of the line

$$x \cos \omega + y \sin \omega = p, \text{ we obtain } \omega = 120^\circ \text{ and } p = 4.$$

Thus, the perpendicular distance of the line from the origin is 4, while the angle between the perpendicular and the positive x-axis is  $120^\circ$ .

- (ii) The given equation is  $y - 2 = 0$

It can be represented as  $0.x + 1.y = 2$

On dividing both sides by  $\sqrt{0^2 + 1^2} = 1$ , we obtain

$$0.x + 1.y = 2$$

$$\Rightarrow x \cos 90^\circ + y \sin 90^\circ = 2 \quad \dots(2)$$

Equation (2) is in the normal form.

On comparing equation (2) with the normal form of equation of line

$$x \cos \omega + y \sin \omega = p, \text{ we obtain } \omega = 90^\circ \text{ and } p = 2.$$

Thus, the perpendicular distance of the line from the origin is 2, while the angle between the perpendicular and the positive  $x$ -axis is  $90^\circ$ .

(iii) The given equation is  $x - y = 4$ .

It can be reduced as  $1.x + (-1)y = 4$

On dividing both sides by  $\sqrt{1^2 + (-1)^2} = \sqrt{2}$ , we obtain

$$\begin{aligned} \frac{1}{\sqrt{2}}x + \left(-\frac{1}{\sqrt{2}}\right)y &= \frac{4}{\sqrt{2}} \\ \Rightarrow x \cos\left(2\pi - \frac{\pi}{4}\right) + y \sin\left(2\pi - \frac{\pi}{4}\right) &= 2\sqrt{2} \\ \Rightarrow x \cos 315^\circ + y \sin 315^\circ &= 2\sqrt{2} \quad \dots(3) \end{aligned}$$

Equation (3) is in the normal form.

On comparing equation (3) with the normal form of the equation of the line

$$x \cos \omega + y \sin \omega = p, \text{ we obtain } \omega = 315^\circ \text{ and } p = 2\sqrt{2}.$$

Thus, the perpendicular distance of the line from the origin is  $2\sqrt{2}$ , while the angle between the perpendicular and the positive  $x$ -axis is  $315^\circ$ .

#### Question 4:

Find the distance of the points  $(-1, 1)$  from the line  $12(x+6) = 5(y-2)$ .

#### Solution:

The given equation of the line is  $12(x+6) = 5(y-2)$

$$\Rightarrow 12x + 72 = 5y - 10$$

$$\Rightarrow 12x - 5y + 82 = 0 \quad \dots(1)$$

On comparing equation (1) with general equation of line  $Ax + By + C = 0$  we obtain  $A = 12, B = -5$  and  $C = 82$ .

It is known that the perpendicular distance ( $d$ ) of a line  $Ax + By + C = 0$  from a point

$$(x_1, y_1) \text{ is given by } d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}$$

The given point is  $(x_1, y_1) = (-1, 1)$ .

Therefore, the distance of point  $(-1, 1)$  from the given line is

$$\begin{aligned} \frac{|12(-1) + (-5)(1) + 82|}{\sqrt{12^2 + (-5)^2}} &= \frac{|-12 - 5 + 82|}{\sqrt{169}} \\ &= \frac{|65|}{13} \\ &= 5 \end{aligned}$$

Hence, the distance of point  $(-1, 1)$  from the given line is 5 units.

### Question 5:

Find the points on the x-axis whose distance from the line  $\frac{x}{3} + \frac{y}{4} = 1$  are 4 units.

### Solution:

The given equation of line is

$$\begin{aligned} \frac{x}{3} + \frac{y}{4} &= 1 \\ 4x + 3y - 12 &= 0 \quad \dots(1) \end{aligned}$$

On comparing equation (1) with general equation of line  $Ax + By + C = 0$  we obtain  $A = 4$ ,  $B = 3$ , and  $C = -12$ .

Let  $(a, 0)$  be the point on the x-axis whose distance from the given line is 4 units.

It is known that the perpendicular distance (d) of a line  $Ax + By + C = 0$  from a point

$$(x_1, y_1) \text{ is given by } d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}$$

Therefore,

$$\begin{aligned} \Rightarrow (4a - 12) &= 20 \quad \text{or} \quad -(4a - 12) = 20 \\ \Rightarrow 4a &= 20 + 12 \quad \text{or} \quad 4a = -20 + 12 \\ \Rightarrow a &= 8 \quad \text{or} \quad a = -2 \end{aligned}$$

Thus, the required points on  $x$ -axis are  $(-2, 0)$  and  $(8, 0)$ .

### Question 6:

Find the distance between parallel lines

- (i)  $15x + 8y - 34 = 0$  and  $15x + 8y + 31 = 0$   
(ii)  $l(x + y) + p = 0$  and  $l(x + y) - r = 0$

### Solution:

It is known that the distance ( $d$ ) between parallel lines  $Ax + By + C_1 = 0$  and  $Ax + By + C_2 = 0$  is

given by 
$$d = \frac{|C_1 - C_2|}{\sqrt{A^2 + B^2}}$$

- (i) The given parallel lines are  $15x + 8y - 34 = 0$  and  $15x + 8y + 31 = 0$   
Here,  $A = 15, B = 8, C_1 = -34$  and  $C_2 = 31$

Therefore, the distance between the parallel lines is

$$\begin{aligned} d &= \frac{|C_1 - C_2|}{\sqrt{A^2 + B^2}} \\ &= \frac{|-34 - 31|}{\sqrt{(15)^2 + (8)^2}} \text{ units} \\ &= \frac{|-65|}{\sqrt{289}} \text{ units} \\ &= \frac{65}{17} \text{ units} \end{aligned}$$

- (ii) The given parallel lines are  $l(x + y) + p = 0$  and  $l(x + y) - r = 0$   
Here,  $A = B = l, C_1 = p$  and  $C_2 = -r$   
Therefore, the distance between the parallel lines is

$$\begin{aligned}
 d &= \frac{|C_1 - C_2|}{\sqrt{A^2 + B^2}} \\
 &= \frac{|p+r|}{\sqrt{l^2 + l^2}} \text{ units} \\
 &= \frac{|p+r|}{\sqrt{2l^2}} \text{ units} \\
 &= \frac{|p+r|}{l\sqrt{2}} \text{ units} \\
 &= \frac{1}{\sqrt{2}} \frac{|p+r|}{l} \text{ units}
 \end{aligned}$$

### Question 7:

Find equation of the line parallel to the line  $3x - 4y + 2 = 0$  and passing through the point  $(-2, 3)$ .

### Solution:

The equation of the given line is

$$3x - 4y + 2 = 0$$

$$y = \frac{3x}{4} + \frac{2}{4}$$

$y = \frac{3}{4}x + \frac{2}{4}$ , which is of the form  $y = mx + c$

Therefore, slope of the given line is  $\frac{3}{4}$

It is known that parallel lines have the same slope.

Slope of the other line is  $m = \frac{3}{4}$

Now, the equation of the line that has a slope of  $\frac{3}{4}$  and passes through the points  $(-2, 3)$  is

$$(y - 3) = \frac{3}{4}\{x - (-2)\}$$

$$4y - 12 = 3x + 6$$

$$3x - 4y + 18 = 0$$

### Question 8:

Find the equation of the line perpendicular to the line  $x - 7y + 5 = 0$  and having  $x$  intercept 3.

**Solution:**

The given equation of the line is  $x - 7y + 5 = 0$

Or  $y = \frac{1}{7}x + \frac{5}{7}$ , which is of the form  $y = mx + c$

Therefore, slope of the given line is  $\frac{1}{7}$

$$m = -\frac{1}{\left(\frac{1}{7}\right)} = -7$$

The slope of the line perpendicular to the line having a slope is

The equation of the line with slope  $-7$  and  $x$ -intercept  $3$  is given by

$$y = m(x - d)$$

$$y = -7(x - 3)$$

$$y = -7x + 21$$

$$7x + y - 21 = 0$$

Hence, the required equation of the line is  $7x + y - 21 = 0$

**Question 9:**

Find the angles between the lines  $\sqrt{3}x + y = 1$  and  $x + \sqrt{3}y = 1$

**Solution:**

The given lines are  $\sqrt{3}x + y = 1$  and  $x + \sqrt{3}y = 1$

$$y = -\sqrt{3}x + 1 \quad \dots(1) \quad \text{and} \quad y = -\frac{1}{\sqrt{3}}x + \frac{1}{\sqrt{3}} \quad \dots(2)$$

The slope of line (1) is  $m_1 = -\sqrt{3}$ , while the slope of the line (2) is  $m_2 = -\frac{1}{\sqrt{3}}$

The actual angle i.e.,  $\theta$  between the two lines is given by

$$\begin{aligned} \tan \theta &= \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right| \\ &= \left| \frac{-\sqrt{3} + \frac{1}{\sqrt{3}}}{1 + \left(-\sqrt{3} \left(-\frac{1}{\sqrt{3}}\right)\right)} \right| \\ &= \left| \frac{\frac{-3+1}{\sqrt{3}}}{1+1} \right| = \left| \frac{-2}{2 \times \sqrt{3}} \right| \\ \tan \theta &= \frac{1}{\sqrt{3}} \\ \theta &= 30^\circ \end{aligned}$$

Thus, the angle between the given lines is either  $30^\circ$  or  $180^\circ - 30^\circ = 150^\circ$ .

### Question 10:

The line through the points  $(h, 3)$  and  $(4, 1)$  intersects the line  $7x - 9y - 19 = 0$ . At right angle. Find the value of  $h$ .

### Solution:

The slope of the line passing through points  $(h, 3)$  and  $(4, 1)$  is

$$m_1 = \frac{1-3}{4-h} = \frac{-2}{4-h}$$

The slope of the line  $7x - 9y - 19 = 0$  or  $y = \frac{7}{9}x - \frac{19}{9}$  is  $m_2 = \frac{7}{9}$

It is given that the two lines are perpendicular

Therefore,

$$\Rightarrow m_1 \times m_2 = -1$$

$$\Rightarrow \frac{-14}{36-9h} = -1$$

$$\Rightarrow 14 = 36 - 9h$$

$$\Rightarrow 9h = 36 - 14$$

$$\Rightarrow h = \frac{22}{9}$$

Thus, the value of  $h = \frac{22}{9}$ .

### Question 11:

Prove that the line through the point  $(x_1, y_1)$  and parallel to the line  $Ax + By + C = 0$  is  $A(x - x_1) + B(y - y_1) = 0$

### Solution:

The slope of line  $Ax + By + C = 0$  or  $y = \left(-\frac{A}{B}\right)x + \left(-\frac{C}{B}\right)$  is  $m = -\frac{A}{B}$   
It is known that parallel lines have the same slope.

Therefore, slope of the other line  $= m = -\frac{A}{B}$

The equation of the line passing through point  $(x_1, y_1)$  and having slope  $m = -\frac{A}{B}$  is

$$y - y_1 = m(x - x_1)$$

$$y - y_1 = -\frac{A}{B}(x - x_1)$$

$$B(y - y_1) = -A(x - x_1)$$

$$A(x - x_1) + B(y - y_1) = 0$$

Hence, the line through point  $(x_1, y_1)$  and parallel to line  $Ax + By + C = 0$  is  $A(x - x_1) + B(y - y_1) = 0$

### Question 12:

Two lines passing through the points  $(2, 3)$  intersects each other at an angle of  $60^\circ$ . If slope of one line is 2, find equation of the other line.

### Solution:

It is given that the slope of the first line,  $m_1 = 2$ .

Let the slope of the other line be  $m_2$ .

The angle between the two lines is  $60^\circ$ .

$$\tan \theta = \left| \frac{m_1 - m_2}{1 + m_1 m_2} \right|$$

$$\tan 60^\circ = \left| \frac{2 - m_2}{1 + 2m_2} \right|$$

$$\sqrt{3} = \pm \left( \frac{2 - m_2}{1 + 2m_2} \right)$$

$$\begin{aligned} \sqrt{3} &= \left( \frac{2-m_2}{1+2m_2} \right) & \sqrt{3} &= -\left( \frac{2-m_2}{1+2m_2} \right) \\ \sqrt{3}(1+2m_2) &= 2-m_2 & \sqrt{3}(1+2m_2) &= -(2-m_2) \\ \sqrt{3}+2\sqrt{3}m_2+m_2 &= 2 & \sqrt{3}+2\sqrt{3}m_2-m_2 &= -2 \\ \sqrt{3}+(2\sqrt{3}+1)m_2 &= 2 & \sqrt{3}+(2\sqrt{3}-1)m_2 &= -2 \\ m_2 &= \frac{2-\sqrt{3}}{(2\sqrt{3}+1)} & \text{or} & m_2 = \frac{-(2+\sqrt{3})}{(2\sqrt{3}-1)} \end{aligned}$$

**Case 1:**

$$m_2 = \frac{2-\sqrt{3}}{(2\sqrt{3}+1)}$$

The equation of the line passing through the point  $(2,3)$  and having a slope of  $\frac{2-\sqrt{3}}{(2\sqrt{3}+1)}$  is

$$(y-3) = \frac{2-\sqrt{3}}{(2\sqrt{3}+1)}(x-2)$$

$$(2\sqrt{3}+1)y - 3(2\sqrt{3}+1) = (2-\sqrt{3})x - 2(2-\sqrt{3})$$

$$(\sqrt{3}-2)x + (2\sqrt{3}+1)y = -1+8\sqrt{3}$$

In this case, the equation of the other line is  $(\sqrt{3}-2)x + (2\sqrt{3}+1)y = -1+8\sqrt{3}$

**Case 2:**

$$m_2 = \frac{-(2+\sqrt{3})}{(2\sqrt{3}-1)}$$

The equation of the line passing through the point  $(2,3)$  and having a slope of  $\frac{-(2+\sqrt{3})}{(2\sqrt{3}-1)}$  is

$$(y-3) = \frac{-(2+\sqrt{3})}{(2\sqrt{3}-1)}(x-2)$$

$$(2\sqrt{3}-1)y - 3(2\sqrt{3}-1) = -(2+\sqrt{3})x + 2(2+\sqrt{3})$$

$$(2-\sqrt{3})x + (2\sqrt{3}-1)y = 4-2\sqrt{3}+6\sqrt{3}-3$$

$$(2-\sqrt{3})x + (2\sqrt{3}-1)y = 1+8\sqrt{3}$$

If the case of the equation of the other line is  $(2-\sqrt{3})x+(2\sqrt{3}-1)y=1+8\sqrt{3}$

Thus, the required equation of the other line is  $(\sqrt{3}-2)x+(2\sqrt{3}+1)y=-1+8\sqrt{3}$  or  $(2-\sqrt{3})x+(2\sqrt{3}-1)y=1+8\sqrt{3}$ .

### Question 13:

Find the equation of the right bisector of the line segment joining the points  $(3,4)$  and  $(-1,2)$ .

#### Solution:

The right bisector of a line segment bisects the line segment at  $90^\circ$ .

The end points of the line segment are given as  $A(3,4)$  and  $B(-1,2)$ .

Accordingly, mid-point of  $AB = \left(\frac{3-1}{2}, \frac{4+2}{2}\right) = (1,3)$

Slope of  $AB = \frac{2-4}{-1-3} = \frac{-2}{-4} = \frac{1}{2}$

$$AB = -\frac{1}{\left(\frac{1}{2}\right)} = -2$$

Slope of the line perpendicular to

The equation of the line passing through  $(1,3)$  and having a slope of  $-2$  is

$$(y-3) = -2(x-1)$$

$$y-3 = -2x+2$$

$$2x+y=5$$

Thus, the required equation of the line is  $2x+y=5$ .

### Question 14:

Find the coordinates of the foot of perpendicular from the points  $(-1,3)$  to the line  $3x-4y-16=0$ .

#### Solution:

Let  $(a,b)$  be the coordinates of the foot of the perpendicular from the points  $(-1,3)$  to the line  $3x-4y-16=0$ .

Slope of the line joining  $(-1, 3)$  and  $(a, b)$ ,  $m_1 = \frac{b-3}{a+1}$

Slope of the line  $3x - 4y - 16 = 0$  or  $y = \frac{3}{4}x - 4$ ,  $m_2 = \frac{3}{4}$

Since these two lines are perpendicular,  $m_1 \times m_2 = -1$

Therefore,

$$\begin{aligned} \Rightarrow \left(\frac{b-3}{a+1}\right) \times \left(\frac{3}{4}\right) &= -1 \\ \Rightarrow \frac{3b-9}{4a+4} &= -1 \\ \Rightarrow 3b-9 &= -4a-4 \\ \Rightarrow 4a+3b &= 5 \quad \dots(1) \end{aligned}$$

Point  $(a, b)$  lies on the line  $3x - 4y - 16 = 0$

Therefore,

$$\Rightarrow 3a - 4b = 16 \quad \dots(2)$$

On solving equations (1) and (2), we obtain

$$a = \frac{68}{25} \quad \text{and} \quad b = -\frac{49}{25}$$

Thus, the required coordinates of the foot of the perpendicular are  $\left(\frac{68}{25}, \frac{49}{25}\right)$

### Question 15:

The perpendicular from the origin to the line  $y = mx + c$  meets it at the a point  $(-1, 2)$ . Find the values of  $m$  and  $c$ .

### Solution:

The given equation of line is  $y = mx + c$

It is given that the perpendicular from the origin meets the given line at  $(-1, 2)$ .

Therefore, the line joining the points  $(0, 0)$  and  $(-1, 2)$  is perpendicular to the given line

Slope of the line joining  $(0,0)$  and  $(-1,2)$  is  $\frac{2}{-1} = -2$

The slope of the given line is  $m$

Therefore,

$$m \times (-2) = -1 \quad [\text{The two lines are perpendicular}]$$

$$\Rightarrow m = \frac{1}{2}$$

Since points  $(-1,2)$  lies on the given line, it satisfies the equation  $y = mx + c$

Therefore,

$$\Rightarrow 2 = m(-1) + c$$

$$\Rightarrow 2 = 2 + \frac{1}{2}(-1) + c$$

$$\Rightarrow c = 2 + \frac{1}{2} = \frac{5}{2}$$

Thus, the respective values of  $m$  and  $c$  are  $\frac{1}{2}$  and  $\frac{5}{2}$

### Question 16:

If  $p$  and  $q$  are the lengths of perpendicular from the origin to the lines  $x \cos \theta - y \sin \theta = k \cos 2\theta$  and  $x \sec \theta + y \operatorname{cosec} \theta = k$ , respectively, prove that  $p^2 + 4q^2 = k^2$

### Solution:

The equations of given lines are

$$x \cos \theta - y \sin \theta = k \cos 2\theta \quad \dots(1)$$

$$x \sec \theta + y \operatorname{cosec} \theta = k \quad \dots(2)$$

The perpendicular distance( $d$ ) of a line  $Ax + By + C = 0$  from a point  $(x_1, x_2)$  is given by

$$d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}$$

On comparing equation(1) to the general equation of a line i.e.,  $Ax + By + C = 0$ , we obtain  $A = \cos \theta, B = -\sin \theta$  and  $C = -k \cos 2\theta$

It is given that  $p$  is the length of the perpendicular from  $(0,0)$  to line (1).

Therefore, 
$$p = \frac{|A(0) + B(0) + C|}{\sqrt{A^2 + B^2}} = \frac{|C|}{\sqrt{A^2 + B^2}} = \frac{|-k \cos 2\theta|}{\sqrt{\cos^2 \theta + \sin^2 \theta}} = |-k \cos 2\theta| \quad \dots(3)$$

On comparing equation (2) to the general equation of line i.e.,  $Ax + By + C = 0$ , we obtain  $A = \sec \theta$ ,  $B = \operatorname{cosec} \theta$  and  $C = -k$

It is given that  $q$  is the length of the perpendicular from  $(0,0)$  to line (2)

$$\text{Therefore, } p = \frac{|A(0) + B(0) + C|}{\sqrt{A^2 + B^2}} = \frac{|C|}{\sqrt{A^2 + B^2}} = \frac{|-k|}{\sqrt{\sec^2 \theta + \operatorname{cosec}^2 \theta}} \quad \dots(4)$$

From (3) and (4), we have

$$\begin{aligned} p^2 + 4q^2 &= (|-k \cos 2\theta|)^2 + 4 \left( \frac{|-k|}{\sqrt{\sec^2 \theta + \operatorname{cosec}^2 \theta}} \right)^2 \\ &= k^2 \cos^2 2\theta + \frac{4k^2}{(\sec^2 \theta + \operatorname{cosec}^2 \theta)} \\ &= k^2 \cos^2 2\theta + \frac{4k^2}{\left( \frac{1}{\cos^2 \theta} + \frac{1}{\sin^2 \theta} \right)} \\ &= k^2 \cos^2 2\theta + \left( \frac{4k^2}{\frac{\sin^2 \theta + \cos^2 \theta}{\sin^2 \theta \cos^2 \theta}} \right) \\ &= k^2 \cos^2 2\theta + \left( \frac{4k^2}{\frac{1}{\sin^2 \theta \cos^2 \theta}} \right) \\ &= k^2 \cos^2 2\theta + 4k^2 \sin^2 \theta \cos^2 \theta \\ &= k^2 \cos^2 2\theta + k^2 (2 \sin \theta \cos \theta)^2 \\ &= k^2 \cos^2 2\theta + k^2 \sin^2 2\theta \\ &= k^2 (\cos^2 2\theta + \sin^2 2\theta) \\ &= k^2 \end{aligned}$$

Hence, we proved that  $p^2 + 4q^2 = k^2$

### Question 17:

In the triangle ABC with vertices  $A(2,3)$ ,  $B(4,-1)$  and  $C(1,2)$ , find the equation and length of altitude from the vertex A.

### Solution:

Let AD be the altitude of triangle ABC from vertex A.

Accordingly,  $AD \perp BC$

The equation of the line passing through point  $(2,3)$  and having a slope of 1 is

$$\begin{aligned} \Rightarrow (y-3) &= 1(x-2) \\ \Rightarrow x - y + 1 &= 0 \\ \Rightarrow y - x &= 1 \end{aligned}$$

Therefore, equation of the altitude from vertex  $A = y - x = 1$

Length of AD = Length of the perpendicular from  $A(2,3)$  to BC  
The equation of BC is

$$\begin{aligned} \Rightarrow (y+1) &= \frac{2+1}{1-4}(x-4) \\ \Rightarrow (y+1) &= -1(x-4) \\ \Rightarrow y+1 &= -x+4 \\ \Rightarrow x + y - 3 &= 0 \quad \dots(1) \end{aligned}$$

The perpendicular distance (d) of a line  $Ax + By + C = 0$  from a point  $(x_1, y_1)$  is given by

$$d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}$$

On comparing equation (1) to the general equation of line  $Ax + By + C = 0$ , we obtain  $A = 1, B = 1$  and  $C = 3$ .

Length of  $AD = \frac{|1 \times 2 + 1 \times 3 - 3|}{\sqrt{1^2 + 1^2}} = \frac{2}{\sqrt{2}} = \sqrt{2} \text{ units}$

Thus, the equation and length of the altitude from vertex A are  $y - x = 1$  and  $\sqrt{2}$  units.

### Question 18:

If  $p$  is the length of perpendicular from the origin to the line whose intercepts on the  $x$ -axis are

$a$  and  $b$ , then show that  $\frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2}$

### Solution:

It is known that the equation of a line whose intercepts on the axis  $a$  and  $b$  is

$$\frac{x}{a} + \frac{y}{b} = 1$$

$$bx + ay = ab$$

$$bx + ay - ab = 0 \quad \dots(1)$$

The perpendicular distance (d) of a line  $Ax + By + C = 0$  from a point  $(x_1, y_1)$  is given by

$$d = \frac{|Ax_1 + By_1 + C|}{\sqrt{A^2 + B^2}}$$

On comparing equation (1) to the general equation of line  $Ax + By + C = 0$ , we obtain  $A = b$ ,  $B = a$  and  $C = -ab$ .

Therefore, if  $p$  is the length of the perpendicular from point  $(x_1, y_1) = (0, 0)$  to line (1),  
We obtain

$$\begin{aligned} p &= \frac{|A(0) + B(0) - ab|}{\sqrt{a^2 + b^2}} \\ &= \frac{|-ab|}{\sqrt{a^2 + b^2}} \end{aligned}$$

On squaring both sides, we obtain

$$\begin{aligned} \Rightarrow p^2 &= \frac{(-ab)^2}{a^2 + b^2} \\ \Rightarrow p^2 (a^2 + b^2) &= a^2 b^2 \\ \Rightarrow \frac{a^2 + b^2}{a^2 b^2} &= \frac{1}{p^2} \\ \Rightarrow \frac{1}{p^2} &= \frac{1}{a^2} + \frac{1}{b^2} \end{aligned}$$

Hence, we showed  $\frac{1}{p^2} = \frac{1}{a^2} + \frac{1}{b^2}$
